THREE SIZES OF TUBING IN ONE PUMP ... PRECISELY!

Like so many products, the deep well reciprocating pump manufactured by Fluid Packed Pump Company of Los Nietos, California, is practically all tubing with the exception of fittings used on the end. And because the pump's components are received as tubes—semi-finished products in themselves—they require much less fabrication than would otherwise be necessary.

For the past 10 years, this company—an acknowledged leader in its field—has used B&W seamless alloy steel mechanical tubing for its product which pumps oil up from subsurface areas of wells. The barrel and plunger of the pump are precision parts which must be held to extremely close tolerances if they are to function properly. The uniform size, wall thickness and concentricity characteristics of B&W Tubing, with its surfaces free from spiral, scratches and pits, combine to make this tubing ideally suited to the Fluid Packed Pump operation.

A closer look at your own product, from both a design and fabrication standpoint, may reveal opportunities for tubing applications that may save time and money and improve your product. Whatever your requirements, B&W Tubing—carbon, alloy or stainless—can meet them. Call Mr. Tubes, or write for Technical Bulletin 365. The Babcock & Wilcox Company, Tubular Products Division, Beaver Falls, Pa.

TA-5024M

Seamless and welded tubular products, seamless welding fittings and flanges—in carbon, alloy and stainless steel

Making a carbon-steel bar into a hard-hitting hatchet

It's surprising but true: this hatchet is made from a round bar of carbon steel. Expert craftsmanship by The Bridgeport Hardware Manufacturing Corp. transforms the bar into a rugged tool that is well known to outdoorsmen everywhere.

Starting with a 1 $\frac{3}{4}$ -in. round of C-1078 steel—one of the carbon grades supplied by Bethlehem—the Bridgeport people hammer-forged the rough pattern shown above. Then the flash is trimmed, resulting in a slender but strong forging, all one piece from head to handle.

Next comes heat-treatment, the vitally important step that gives the ax its ability to hold a keen edge through years of punishing service.

The finishing operations include polishing, sharpening and painting, as well as installing grips of tough, second-growth hickory.

The requirements of hand-tool makers, as well as those of many other active and growing industries, have created an unprecedented demand for hot-rolled carbon-steel bars. We're doing our best to meet this demand, all the while maintaining our customary quality standards.

For further information about carbon bars, kindly contact the Bethlehem sales office nearest you.

Level off the peaks with PHILGAS®

Avoid high demand charges for gas by installing your own

STANDBY **PHILGAS** SYSTEM

Peak-shaving with a standby Philgas system is like having your own gas well. You can put Philgas into operation without delay when your gas needs threaten to exceed your contract limitations for natural or manufactured gas. Installing a Philgas system is easy and requires little capital investment. It is automatic in operation.

Philgas . . . America's largest selling LP-Gas . . . is an exceptionally clean fuel with no harmful contaminants. It is a Phillips Petroleum Company product, manufactured to rigid standards of quality and uniformity. You can't get a better fuel for heat treating, space heating, or powering trucks and heavy duty equipment. Full information on request.

Philgas is our name for high-quality LP-Gas—Bottled Gas—Butane—Propane.

Lowers Welding Costs!

Speeds Fabrication!

Brings EXTRA PROFITS

...on your jobs!

BIG BROTHER has extra engine power to make full use of generator capacity on jobs in the 250 amp. welding range.

HUSKY BOY 200 amp. for general shop and outside repair work. Easy to move from one job to another.

AC POWER-AC WELDER 200 amp. for general service welding or power for operating drills, lights, grinders, motors, pumps, etc.

You'll like the new advantages you get with **HOBART** air-cooled welders

Modern type arc welding **ELECTRODES**

that give you faster production. If you haven't checked the advantages of the latest advancement in welding electrodes, you'll want to try these NEW HOBARTS.

- easy striking arc
- lower finishing costs
- faster metal deposit
- lower spatter loss

"CONTRACTOR'S SPECIAL"—a 250 amp. Gas Drive model that's light and compact, yet has plenty of engine power and a hot, fast, dependable arc.

Electric Drive Welders

"Powromatic" DC Rectifier

DC Rectifier

"Bantam Champ"

Generator Only

Transformer Welder

YOU HAVE YOUR CHOICE WITH HOBART

Here's the best way to produce superior welding at less expense: Choose a welder that's especially designed to do your work. And this is equally important: before buying that welder, find out if it's rugged enough to give you years of trouble-free service.

Do some close investigating and you'll quickly see why Hobart welders are outstanding. Each welder in Hobart's complete line has extra "muscle" in the form of rugged construction, constant top performance, easier arc control, extra capacity and cooler operation.

Built-in convenience features enable you to get your work done quickly and easily. Try a Hobart. See for yourself.

Save the Cost of Diamonds with

EX-CELL-O

Method X

TOOL

SHARPENER

- ★ Cuts any conductive material
- ★ Does both roughing and finishing
- ★ Cuts carbides and steel at the same time

Now you can sharpen the hardest single-point tools without using diamonds or abrasive wheels. Using the electric-spark principal in off-hand sharpening, Ex-Cell-O Method X produces a non-directional matte finish with none of the abrasions caused by conventional grinding. The coarseness of texture and cutting speeds are controlled by an electric control switch. The "grinding wheel" is actually a 10" cast-iron disc which is rotated by an Ex-Cell-O precision spindle with inbuilt motor. A spark gap is maintained between the disc and work piece across which current pulsations jump to do the cutting. No coolant is required in the sharpening process.

After brief instruction, men with conventional grinding experience can readily adapt their skill to Method X. Get all the facts about this new cost-saving process—get in touch with your local Ex-Cell-O representative today.

Style 43 Ex-Cell-O
Method X Tool Sharpener.

Popular at the Show. At the Machine Tool Show, hundreds of men were impressed by this diamondless tool sharpener that lengthens the life of carbide tools because it leaves NO heat checks, NO grinding cracks, and NO saw-tooth cutting edges.

behind the scenes

Editor Meets Tree

Thanks to dedicated men who stood waist-deep in snow drifts armed with cold determination and strong magnifying glasses, we know that the various types of snow crystals do not occur with equal frequency. This may knock you right off your feet, friends, but the news is out: In any given snow storm you simply won't find as many columnar snow crystals as you will the tabular type. Over a large part of the country this week a great mess of these crystals lay heavily upon the land, and the only person we knew who deliberately snuggled up to them was Associate Editor Robert Jaynes. He wasn't counting the crystals, though; he was sliding on them.

This may sound preposterous, but Bob was sailing around on a flying saucer when he ran into a tree that was sticking about 40 ft out of the snow. The flying saucer is a deep metal dish, almost large enough to accommodate a plump young editor curled up with an apple in his mouth. This particular dish belonged to Jaynes's son, but daddy had to try it out first on a snowy hillside. He stepped aboard, folded himself yogi fashion, and set off down the hill like an oversized and whirling apple dumpling. Having no control over his weird vehicle, he crashed into a sturdy oak. His elderly playmates tried to snap his shoulder back into place, an episode he remembers with no pleasure.

"I heard it click," said Bob, reaching into the sling that held his arm, plus things usually carried in his right pocket. "And I want to tell you that's the last time I want to click in a flying saucer!"

Those Good Old Days?

Robert Huber, STEEL's alert machine tool editor bobbed up with a worn copy of Warner & Swasey's *Turret Topics*, dated December, 1955. "It might be out of date," Bob explained, "but that's because I held on to it so long. Just take a look at this story about the good old days, and be glad you ain't living 50 years before your time." He looked closely at our

seamed and weathered countenance and added: "Or have you?"

When Wanamaker's department store in New York closed its door a year ago, writes the editor of *Turret Topics*, somebody dug into the records, and found this notice which appeared on the store's bulletin board in 1854:

"Store must be open at 6:30 a.m. and remain open until 9 p.m. the year round . . . A pail of water and a scuttle of coal must be brought by each clerk before breakfast, there is time to do so, and attend to customers who call.

"This store must not be open on the Sabbath unless absolutely necessary. Any employee who is in the habit of smoking Spanish cigarettes getting shaved at the barber shop going to dances and other places of amusement will most surely give his employer reason to be suspicious of his integrity and all-around honesty. Men employees are given an evening a week for courting purposes, and two if they go to prayer meeting regularly. After 14 hours of work in the store, the leisure time must be spent in reading good literature."

Pass the Aspirin

A moment ago we were speaking of plump young editors, which reminds us that Keith Carlson, associate editor of *Machine Design*, was kind enough to contribute a puzzle: "I stole it from the *Georgia Tech Engineer*," he confessed blandly, handing over the purloined problem. "It's so good, I think it ought to have wide circulation. I figured out the answer myself. Can you?"

Certainly not—but you bright people out there can work it. Two studios were furnished only with chairs and three-legged stools. Each studio was furnished differently. If all the legs in each studio were stools, and all the stools were chairs, and all the chairs were removed, there would be 100 too many legs in each studio. How were the studios furnished?

New...

ELPAR RAM TRUCKS

ONLY THE "R" SERIES RAM TRUCKS GIVE YOU SO MANY VALUES!

ELPAR designers and major steel mill engineers worked together to design this brand new line of coil handlers.

These trucks combine the best of previous models, plus new features learned from over thirty years' experience building heavy-duty ram trucks. You can count on "R" series ram trucks to handle more tons per hour than ever before!

Check These Design Features:

Narrowest Ram Truck Built . . . Get more efficient use of storage space and operate in narrower aisles.

Power Actuated Hydraulic Wheel Brakes . . .

Actually two independent braking systems for maximum safety.

Picture Window Vision . . . Lift chains are eliminated for perfect vision between uprights.

Countless Safety Features . . . You'll find it hard to count all the features that assure safety to the load, operator and truck.

Dual Power Plants . . . Maximum power and flexibility. Drive motors are fully protected inside the frame.

The "R" series ram trucks will surprise you with their dependability, safety and economy.

Ask for new bulletin—"R" Series Ram Trucks.

Close-up of operator's field of vision. Note how clearly he can see the tip of the ram, for easy spotting of loads. Controls permit right, left or center operation.

PRODUCTION PLATING WITH UDYLITE-SELENIUM

75,000 amperes of Rectification with push-button control

In this ultra-modern automatic plating operation the rectifiers selected were Udylite Selenium—with a total output of 75,000 amperes.

30,000 amperes at 2 to 9 volts are used alone for the nickel plating operation. These selenium rectifiers are controlled automatically by a single push button control. No matter how much work is in or out of the tank, the amount of voltage is automatically adjusted to remain constant.

The chromium plating is equipped with 9 volt selenium rectifiers. Each rack of work goes into the chrome plate "live" at approximately 3 volts. When the racks arrive at the bottom of the down stroke a strike voltage of 9 to 18 volts is applied for a few seconds—then the voltage is lowered to regular plating voltage—and it's all done automatically!

Udylite has engineered hundreds of similar installations of all sizes for all kinds of metal finishing operations. Why not call on this experience for your rectifier problems—either Selenium or Germanium? Write us today.

Why Be Robbed of Profits?

I think your article, "Know Your Costs" (Mar. 19, page 83), is well done and I send my congratulations to you. I am routing it among our accounting personnel since there are some factors listed which I feel are important to this company.

Frank Griesinger
Assistant Treasurer
Lincoln Electric Co.
Cleveland

I feel this article is timely. It was of interest to me since it dealt in part with foundry cost problems. I would appreciate ten copies.

P. L. McCulloch Jr.
President
Electro-Alloys Division
American Brake Shoe Co.
Elyria, O.

This article can help me in my work. We are working on the installation of a cost standard system, and I have found several features in your story which can be of help to me. I would like two reprints.

Herman W. Kau
Standard Cost Department
Creamery Package Mfg. Co.
Lake Mills, Wis.

Statement Brings Rebuttal

Your article, "Scale Sales Get Fatter" (Feb. 27, page 81), makes this statement: Mechanical scales have an 0.1 per-cent-accuracy rating, while electronic scales are accurate to 0.25-per cent.

As the primary manufacturer of the SR-4 bonded strain gage type of load cells used in the majority of electronic scale installations, we would like to take exception to this statement.

We are producing standard load cells that are guaranteed to 0.1-per cent or better and have made scale installations that comply with the *National Bureau of Standards Handbook H-44* tolerance

(Please turn to page 12)

When does surface smoothness begin to waste your money?

In most plants today when a design engineer specifies a certain finish on a part, no one in production knows whether the part will be overmachined, too smooth, or too rough until that part reaches the inspection department. Then it is too late.

The costly consequence is that the company loses money on every part finished too well, AND on every reject resulting from underfinishing. Surface finish begins to waste your money at two pre-critical points . . . *the moment you finish a part a single microinch better than the specification requires, and the moment you finish a part a single microinch worse than required.*

Surprising as it may seem, most in-process checking today consists of judg-

ing how the finish *looks* and how it *feels* because no accurate, portable, in-process checking equipment has been available. The production department had no tool that could instantly tell the machine operator when he had met the specification.

What has been done?

Brush has developed an amazingly rugged electronic surface measuring device called the SURFINDICATOR* which can be carried anywhere in the shop to obtain an instantaneous, accurate in-process measurement of roughness on any surface — flat, round or inside-a-hole.

Now you can set up optimum specifications for surface finish based on your laboratory or pilot model tests . . . and then hand a reliable instrument to the production department to help them meet those specifications with no waste of worker or machine time. You can mount SURFINDICATORS at each machine or set up checking stations throughout the plant. And your regular machine operators can use them . . . it doesn't take an expert.

How It Works

All the user does is pass the stylus over the surface in question and take a direct reading. It's simple, fast, accurate and above all it's practical . . . for metallic surfaces and for glass, porcelain, plastic, paper and other materials.

This new booklet on the Brush Surfindicator includes the new ASA standards . . . will help you establish economical surface finish control.

You should know all about this portable device, its many, many uses and the savings it can mean to your company. We tell the whole story in a new booklet which also includes the new ASA standards on surface finish for industrial use. Write for your copy today on your company letterhead. *T.M.

Brush Surfindicator takes out the costly guesswork of finish control. It's portable . . . weighs only 15 lbs.

(Concluded from page 10)

for scale accuracies, requiring an acceptance tolerance of 0.05-per cent.

Admittedly, electronic weighing is new to industrial applications, and the technology of electronic weighing is in its infancy, but the fact remains that this type system is quite capable of meeting the current standards of scale accuracy.

The real problem is in proper interpretation of existing tolerances, which have been written for mechanical scales, when applied to electronic scales.

STANOIL Industrial Oil

tough performer

in delicate operation

A. T. Wallace (right), President of Wallace Tool and Die Company, and Standard Oil lubrication specialist, H. A. Peterson, check sensitivity of new Cincinnati Hydro-Tel Milling Machine which uses STANOIL as hydraulic medium. Howard Peterson has been providing technical service to customers since joining Standard Oil. He is a graduate of General Motors Institute. Howard's customers find this experience pays off for them.

Delicate operations with metal requiring almost a surgeon's skill are every day stuff to Wallace Tool and Die Company, Indianapolis. Recently, they purchased a Cincinnati Hydro-Tel Milling Machine for their highest precision work. They selected STANOIL Industrial Oil for the hydraulic medium. The reason for choosing STANOIL: they wanted a hydraulic fluid that could deliver high performance. They wanted a clean hydraulic system, free of deposits that might clog filters and interrupt operations. They wanted smooth operation without pump chatter and without foam. They got these with STANOIL.

How did Wallace Tool and Die come to choose STANOIL? The answer is not hard to find. They had used STANOIL for hydraulic systems throughout their plant for many years. It has given them the results they wanted so it was natural to pick STANOIL for their new Cincinnati machine.

With STANOIL the machine performs the delicate operation of contour tracing with only 3½ ounces of pressure needed to control the milling cutters. STANOIL gives them smooth, steady, uninterrupted performance.

STANOIL can serve you. In the Midwest a lubrication specialist at your nearby Standard Oil office will be glad to show you. Call him. Or contact Standard Oil Company, 910 South Michigan Avenue, Chicago 80, Illinois.

STANDARD OIL COMPANY (Indiana)

Veteran Chief takes post-graduate training at Ansul fire school...you can too

Throughout his entire career, Floyd Dumas has practiced what he preached . . . *you can't have too much fire training*. So it was logical that this veteran of 29 years' experience should attend Ansul's Fire Training School. As Chief of Fire Prevention for Parke Davis & Co., one of the nation's leading manufacturers of pharmaceuticals, his responsibilities are tremendous. The information Floyd took home from the Ansul School was passed on to each member of his staff who will be better firefighters for it.

You too can have this training. Ansul is the nation's pioneer in the field of fire training, and the only manufacturer to offer this important service to its customers. It is just one of many "extra" services made available to all Ansul users. And there is no charge

whatsoever. Since 1940 this unique school has graduated over 2,800 students from all over this hemisphere, parts of Europe, Asia, and the Middle East.

Training at the Ansul Fire School is of the practical kind. The classroom is Ansul's five-acre test field containing all the latest equipment, and staffed by expert instructors. You owe it to your business, to your position, to learn more about the Ansul Fire Training School.

Get in touch with your local ANSUL MAN through the yellow pages of your phone directory, or write to THE ANSUL CHEMICAL COMPANY, DEPT. S-4, MARINETTE, WISCONSIN.

to many a design problem

ALLEN DOWEL PINS

ALLEN DOWEL PINS are being profitably employed in a thousand and one ingenious ways beyond their conventional applications in tool and die work — as economical roller bearings, as axles, precision plugs, hinges and wrist pins to name a few.

If you have an application that will utilize the great strength, accuracy and fine finish of Allen Dowel Pins, you can save substantially on the cost of your product — because you can secure them at favorable prices right from your Allen Distributor's stock.

Check the quick facts at the right and write directly to Allen's Engineering Department for further technical information.

SPECIFICATIONS

- Made from Allenoy heat treated steel. Surface hardness 62-64, Rockwell C scale; core hardness 52-54. Case depth .010" to .020" depending on size.
- Single shear strength 160,000 to 180,000 p.s.i.
- Surfaces precision ground to $\pm .0001$ " with micro-inch finish of 6 RMS max.
- Sizes: Diameters, $\frac{1}{8}$ " to 1". Lengths, $\frac{3}{8}$ " to 6".
- Two standard oversizes — .0002 for press fits between mating parts, or .001 for repair work, or holes machined oversize.

High Speed Steel Blades

1 They outlast standard
steel blades 10 to 11

2 They assure high speed
cutting performance
second to none.

3 They are substantially
lower in cost than any
other type high speed
steel blades!

Star was the first to successfully use molybdenum to make "Moly"® High Speed Steel Blades that would be tough, carry the load, retain sharpness and embody all the other high qualities and properties of heavy-duty blades. Order "Moly" High Speed Steel Blades from your Industrial Distributor. Rely on him for *all* your metal-cutting needs. Remember, he carries the complete line of STAR Hand and Power Hacksaws, Metal and Wood Cutting Band Saws and Hacksaw Frames.

IF
YOU
MAKE

Springs

YOU'LL DO BETTER WITH ROEBLING

ROEBLING makes high carbon steel spring wire and flat spring steel...and makes it *better*...for every sort of spring and for every product that requires spring characteristics. Hard drawn, hard rolled, annealed or soft, tempered or untempered ...they're all available to meet your requirements exactly.

Among these Roebling materials are zig-zag and no-sag wires; mechanical and valve spring wires; music wire; clock and motor type spring wires; flat spring steel and upholstery spring wire of all types. The variety of parts into which these are formed is almost endless, but manufacturers all report that Roebling quality and uniformity reduce machine downtime.

Learn for yourself how Roebling can help your production and product. John A. Roebling's Sons Corp., Trenton 2, N. J.

ENDURO STAINLESS

used for safety and corrosion-resistance

Above, refueling the Viscount at Cleveland Hopkins Airport. At left, a stainless steel filler neck is welded to stainless steel section of the tank at Wilco, Inc., Kenton, Ohio and Shelbyville, Tennessee. There's no weakness here. The welded seams will last as long as the walls themselves.

REPUBLIC

World's Widest Range of Standard Steels

STEEL . . .

in refueling the Viscount

A unique tank truck, used in refueling Capital Airlines' new Viscount—the world's first turboprop airliner—has been developed by Shell Oil Company and built by Wilco, Inc.

The tank consists of two separate compartments. One containing Shell Fuel is fabricated from Republic 50 High Strength Steel for lightness and strength. The other is fabricated from Republic ENDURO Stainless Steel, Type 302, to resist the corrosive effect of the alcohol-water mixture. The two compartments are then welded together into one strong, integral unit.

ENDURO Stainless Steel has literally thousands of both ground and air applications. And it is economical to use because it does so many jobs so well at the lowest ultimate cost.

You can use ENDURO in thinner, lighter sections to save weight or gain space without loss of strength, without sacrifice of safety. ENDURO's exceptionally high strength-to-weight ratio and fatigue-resistance provide these bonus benefits.

ENDURO has proved its ability to resist heat in countless applications including compressors, turbines, after-burners, fire-walls and shrouding. Now it is replacing other metals that cannot retain their strength at the high temperatures produced by air friction at supersonic speeds.

Republic is the world's largest producer of aircraft steels—stainless steel, alloy steel and titanium. Our metallurgists and engineers are ready to help you apply them to your design or development work. Just send the coupon for more information.

OTHER REPUBLIC PRODUCTS FOR THE AIRCRAFT INDUSTRY

◀ **ALLOY STEELS** are exceptionally strong. Their high strength-to-weight ratio permits smaller sections to carry heavier loads at higher speeds with no sacrifice in strength or safety. These fine steels lengthen service life in all types of parts and equipment. Republic metallurgists will help you use these steels to the best advantage.

▶ **TITANIUM** can save hundreds of pounds per plane. Its lightweight and high strength factors plus outstanding resistance to corrosion make it an extremely attractive metal for use in nacelle construction, firewalls, frames, etc. Republic produces titanium and titanium alloys in hot rolled and cold drawn bars, sheets, plates and billets.

BARGES BOOST FLORIDA-MIDWEST COMMERCE

Twelve new barges now in operation on U. S. waterways are providing through service shipment of low-cost bulk commodities between Florida and the Midwest.

Formerly the high cost of transferring cargo from deep water vessels to river barges, as well as time lost in warehousing, made all-water transportation non-competitive.

Recognizing the future in this business if such expenses could be eliminated, officials of the A. L. Mechling Barge Lines, Inc., Joliet, Illinois, met with representatives of Dravo Corporation. In "Round Table" discussions, exchange of technical and operat-

ing information led to a new barge design which incorporated both the structural strength necessary in deep water operation and the low resistance and shallow draft required in the inland waterways.

Dravo has played an important part in many such projects aimed at furthering water transportation progress. This is another example of more than 60 years of service to business and industry in many fields, with customer satisfaction essential in every transaction. For more information write DRAVO CORPORATION, PITTSBURGH 25, PENNA.

For the newest in coated abrasives... watch BEHR-MANNING!

Grinding and finishing output soars with this latest coated abrasive belt application!

BEHR-MANNING ABRASIVE BELTS team with the new Production Machine Co. #486 Centerless Grinder to produce fast, precision finishes on light round stock. For example, the operator (above) feeds small hardened steel pins at the rate of 20 fpm into the gravity chute. The end result is a continuous flow of finished pieces measuring .375" to .3752" in diameter, with a concentricity of .00015" and a finish of 4-10 rms.

This is another case of proven, modern methods combining with up-to-date Behr-Manning coated abrasive belt applications to provide

industry with superior finishes at record-breaking speeds.

Your finishing operations might require an entirely different abrasive belt application. If so, check with your nearest BEHR-MANNING Demonstration Room for the latest time-saving method. Call your local Behr-Manning Representative, or write direct to Behr-Manning, Troy, N. Y., Dept. S-4.

ANTISEP

the all-purpose water-soluble cutting base

Really
Cool Cutting

Longer Tool Life
... Fewer Rejects

Stepped-up
Production

Extra Profits
in the Bank!

Cool Profits...when **ANTISEP** works for you!

Cooler, faster, cleaner cutting . . . longer tool life and less rejects . . . these are the things that make machine tools pay off in extra profits.

With *Antisep* All-Purpose Base on the job, you start collecting dividends right away—

... **it's inexpensive.** Because *Antisep* Base is cut 25 to 1, or more, with water, it costs less than 8c a gallon in the machine.

... **tools last longer.** *Antisep's* tough film and speedy water cooling keep tools and work cooler than any straight cutting oil could. Cases on record show tool life increased 12 times and more!

... **production increases.** *Antisep* Base's high lubricity withstands pressure and reduces friction. Machines can be run faster—rejects are reduced.

Put *Antisep* Base to the test on the toughest jobs in your plant. Check the results yourself and increase the profits from your machining operations. Call your Houghton Man today or write direct to E. F. Houghton & Co., 303 West Lehigh Avenue, Philadelphia 33, Pa.

Apr. 4-6, American Society of Lubrication Engineers: Annual meeting and exhibit, William Penn hotel, Pittsburgh. Society's address: 84 E. Randolph St., Chicago 1, Ill. Administrative secretary: William P. Young-claus Jr.

Apr. 4-6, Rail Steel Bar Association: Annual meeting, Boca Raton hotel and club, Boca Raton, Fla. Association's address: 38 S. Dearborn St., Chicago 3, Ill. Secretary: W. H. Jacobs.

Apr. 4-7, National Screw Machine Products Association: Annual meeting, Schroeder hotel, Milwaukee. Association's address: 2860 E. 130th St., Cleveland 20, O. Executive vice president: Orrin B. Wernitz.

Apr. 8, Packaging Machinery Manufacturers Institute: Spring meeting, Dennis hotel, Atlantic City, N. J. Institute's address: 342 Madison Ave., New York 17, N. Y. Executive director: R. L. Sears.

Apr. 8-12, Scientific Apparatus Makers Association: Annual meeting, Belleview-Biltmore hotel, Belleair, Fla. Association's address: 20 N. Wacker Dr., Chicago 6, Ill. Executive vice president: Kenneth Andersen.

Apr. 9-11, American Institute of Mining & Metallurgical Engineers: Meeting of National Open-Hearth, National Blast Furnace, Coke Oven and Raw Material Committees, Netherland Plaza hotel, Cincinnati. Institute's address: 29 W. 39th St., New York 18, N. Y. Secretary: E. O. Kirkendall.

Apr. 9-12, American Management Association: Packaging conference, Convention Hall, Atlantic City, N. J. Association's address: 1515 Broadway, New York 36, N. Y. Vice president-secretary: James O. Rice.

Apr. 9-12, Society of Automotive Engineers Inc.: National aeronautic meeting, aeronautic production forum and aircraft engineering display, Hotel Statler, New York. Society's address: 29 W. 39th St., New York 18, N. Y. Secretary: John A. C. Warner.

Apr. 10-11, American Society of Mechanical Engineers: Machine design conference, Bancroft hotel, Worcester, Mass. Society's address: 29 W. 39th St., New York 18, N. Y. Secretary: C. E. Davies.

Apr. 10-12, Metal Powder Association: Annual meeting and show, Hotel Cleveland, Cleveland. Association's address: 420 Lexington Ave., New York 17, N. Y. Secretary: Robert L. Ziegfeld.

Apr. 12-17, National Association of Architectural Metal Manufacturers: Annual meeting, Belleview-Biltmore hotel, Belleair, Fla. Association's address: 228 N. LaSalle St., Chicago 1, Ill. Executive secretary: William N. Wilson.

Apr. 15-19, American Hardware Manufacturers' Association: Spring convention, Roosevelt hotel, New Orleans. Association's address: 342 Madison Ave., New York 17, N. Y. Secretary-treasurer: Arthur Faubel.

Apr. 16-17, American Society of Mechanical Engineers: Gas turbine power conference, Hotel Statler, Washington. Society's address: 29 W. 39th St., New York 18, N. Y. Secretary: C. E. Davies.

Apr. 18-19, Bituminous Coal Research Inc.: Annual meeting, Deshler Hilton hotel, Columbus, O. Association's address: 804 Southern Bldg., Washington, D. C. Secretary: C. A. Reed.

Apr. 18-19, Armour Research Foundation of Illinois Institute of Technology: National industrial research conference, Sherman hotel, Chicago. Foundation's address: 10 W. 35th St., Chicago 16, Ill.

Apr. 19-21, Gas Appliance Manufacturers Association: Annual meeting, Greenbrier, White Sulphur Springs, W. Va. Association's address: 60 E. 42nd St., New York 17, N. Y. Secretary: Harold Massey.

SAFE HOISTING

THAT PAYS OFF IN SAVINGS

Safe hoisting demands more than devices to protect man, load and hoist. Equally vital are *invisible values*: experienced engineering, careful selection of materials, precision manufacture and thorough tests.

The Series "600" 'Load Lifter' Electric Hoist has *two* powerful, automatic brakes. Each alone can hold the full load. Modern 'Load Lifter' Hoists were first to have safe 24 volts at the push buttons. Steel suspension, tough wire rope and non-fracturing load hook provide extra strength for heavy-duty service. All operating parts are enclosed, but the hoist can be serviced safely *in the air*.

Safety . . . quality . . . performance — the Series "600" 'Load Lifter' Electric Hoist is "okay on every count." It is fast — lifts 1000 lbs. at 30 FPM. Sizes: ½ and 1-ton. All types of suspension, including motorized trolley. Call your "Shaw-Box" Distributor or ask us for Bulletin 408.

'Load Lifter'® ELECTRIC HOISTS

MANNING, MAXWELL & MOORE, INC.

MUSKEGON, MICHIGAN

Builders of "SHAW-BOX" and 'LOAD LIFTER' Cranes, 'BUDGIT' and 'LOAD LIFTER' Hoists and other lifting specialties. Makers of 'ASHCROFT' Gauges, 'HANCOCK' Valves, 'CONSOLIDATED' Safety and Relief Valves, 'AMERICAN' and 'AMERICAN-MICROSEN' Industrial Instruments, and Aircraft Products.

This CINCINNATI...

1 1/2" thick x 12'

This 15012 Series Cincinnati All-Steel Shear has a 36" gap and a 48" back gauge range.

Power for heavy cutting with accuracy and operating convenience are combined in this machine.

Modern features such as—Hydraulic Holddowns, Front Operated Power Back Gauge, Hinged Back Gauge Angle, Automatic Pressure Lubrication, All-Steel Interlocked Construction, Forged Alloy Steel Eccentric Shaft—all contribute to an outstanding performance with low maintenance and high accuracy.

This is a plain Ruff-L-Buff after wearing off about one inch in testing operations and then trimming. Loose threads, broken material and numerous small holes due to excessive heat and abrasion of the cloth are apparent.

30%

LONGER BUFF LIFE

The Binderized Ruff-L-Buff shown here was subjected to the identical test undergone by the untreated buff — yet look at the difference! Notice the absence of thread, or cloth breakage of any kind, proof of Binderizing's effect on buff life.

with H-VW-M Binderized* Ruff-L-Buffs®

Not just "another type of buff," but a revolutionary H-VW-M process which impregnates the entire Ruff-L-Buff with the same organic binder used in buffing compounds. From these "Binderized" Ruff-L-Buffs come a host of practical, cost-cutting advantages, proved over many months in actual production line operations.

Item by item, these are the six major advantages of the H-VW-M Binderized Ruff-L-Buff.

- **Longer buff life** — damage from overheating eliminated by pre-lubrication of buffing material, preventing excess frictional heat caused by constant flexing. This additional buff life has averaged 30% in actual test runs.
- **Better compound adherence** — the binderizing impregnation creates an affinity between buff and compound. The compound does the cutting, not the buff.
- **Faster cutting action** — more compound is retained on the buff, insuring an even cut for a longer period without re-application of compound.
- **Extended composition life** — additional binder in the cloth ensures better abrasive adhesion, longer life of both composition and buff.
- **Heading-up time** — new wheels require only application of the compound to be ready for immediate operation.
- **Cooler running** — in addition to pre-lubrication, six holes in the center and twelve air channels in the center rim provide a forced air circulation over all cloth surfaces.**

And, of course, Binderized Ruff-L-Buff retain such important features as *bias-cut cloth* to prevent unravelling, *perfect buff balance* for uniform rotation and wear, and *exclusive Red-E-To-Use face* that takes compound without need for surface preparation.

H-VW-M bias-cut Sisalweev buffing wheels are also available in Binderized types.

* Patent Pending

** Patent No. 2,140,208

For complete information on H-VW-M Binderized Ruff-L-Buffs and other specialized buffs write for Bulletin No. B-102.

DoALL's New Demon
High-Speed Steel Saw Band

High-Speed Steel Saw Bands Bring Big Profits to Cut-Off Operations!

The figures at the left cover just one typical example of the greatly increased cut-off efficiencies made possible by DoALL's new Demon *high-speed steel* saw band on DoALL's new Power Saw.

Performance records from industry prove that plants large and small make big profits on their cut-off work with this new blade and machine combination. They do more accurate work, faster and with less waste of material. They have no trouble meeting production schedules and they often can replace two or three machines with one new DoALL unit.

See the new Demon saw band in operation at your plant — demonstration is free. Just call your local DoALL Store or write:

How the right "COAT" solves many spring problems

• Unless you yourself go in for forming wire springs, you have no idea what a tricky business it is. For one thing, as every fabricator knows, it takes extreme uniformity in the wire to obtain the precise dimensions and the exacting tension, torsion or compression characteristics so often required.

But uniformity alone won't always do the trick! As a leading supplier of special wire for tougher-than-usual spring requirements, National-Standard has delved deep into production problems and has come up with answers that help many a fabricator hold better to tough specifications and produce faster with less waste

and more profit!

Time and again, for example, National-Standard has shown that merely a change in wire *coating* or lubrication quality is of major importance in forming operations. Proper coating also helps gain uniform dimensional response to heat treating. Quite often, in fact, troubles chalked up to wire variance are really the fault of improper coating or finish.

Helping fabricators solve problems and cut costs is a National-Standard specialty. We're geared for it and make a point of it. Try us and see!

expanding mill standardizes on

To meet ever-increasing demands for specialized steel, an eastern mill has completed an extensive expansion program consisting of a new reversing cold mill and two auxiliary lines. Significantly, Allis-Chalmers control is utilized in all three operations.

Progressive mills are taking advantage of Allis-Chalmers experience in engineering, building and applying steel mill control — control that provides smooth, precision performance — control that affords maximum production and top quality with a minimum of outage time and maintenance. Get all the facts about Allis-Chalmers mill control. See your A-C representative or write Allis-Chalmers, General Products Division, Milwaukee 1, Wisconsin.

PICKLING LINE

The Allis-Chalmers control on this line provides an exceptionally wide speed range of more than 15 to 1. Power for the line comes from three separate m-g sets employing magnetic amplifiers for quick response. Complete synchronization between entry, processing and delivery sections permits continuous mill operation.

ANNEALING LINE

This control features power-type magnetic amplifier regulation for accurate control and low maintenance. Variable voltage power is obtained from a six-machine m-g set. Speed regulation of .5% assures constant strip speed and a resulting uniformity of high quality steel. Open-type control boards utilize Allis-Chalmers components especially designed for mill operation.

ALLIS- STEEL

ALLIS-CHALMERS

CONTROL

REVERSING MILL

Critical percentage reduction of specialized steels rolled with this mill requires exacting control. Main mill voltage and reel tension circuits utilize new high-gain magnetic amplifier control. Because the magnetic amplifier is a static device, maintenance and necessity of replacement parts are reduced to a minimum. Fast arc-centering blowout on the dc contactors, shown on the control board, extends contact and chute life. Exceptional interchangeability of contactor and relay parts affords maximum convenience and economy.

A compilation of facts on the handling and shop treatment of Huron. Includes complete information on forging, annealing, tempering, etc. and detailed laboratory data on physical characteristics. Ask for your free copy.

Address Dept. S-76

A Chicago bench shear manufacturer produced some test blades of Ludlum HURON die steel—heat treated to 61-62 Rockwell C.

Service life of the HURON blades proved to be four to five times that of the former blades. Resharpenings were reduced 75 to 80%! Because these new HURON blades held an exact rake and maintained a proper cutting arc, they easily sheared $\frac{3}{16}$ " mild steel or 10 gauge stainless.

Ludlum Huron was developed for use

where high resistance to wear and abrasion is necessary, and where heavy pressure rather than sudden shock must be withstood. Huron has excellent non-deforming properties, and hardens to a great depth.

There is an A-L tool steel that will help solve your cutting, forming or blanking problem. Call our nearest office or distributor today, or write *Allegheny Ludlum Steel Corporation, Oliver Building, Pittsburgh 22, Pennsylvania.*

STEEL

Left—Allen-Bradley Size 7 solenoid contactor used in large solenoid starters.

Below—Allen-Bradley Size 7 solenoid starter with overload relays in NEMA Type 1 general purpose, floor mounted enclosure.

ALLEN-BRADLEY SOLENOID STARTERS USE DOUBLE BREAK, SILVER ALLOY CONTACTS THROUGHOUT!

Eight Sizes up to 300 hp, 220 v; 600 hp, 440-550 v.

Bulletin 709 solenoid starters shown here in Sizes 0 to 6—all equipped with accurate and reliable overload relays.

All starter manufacturers use the solenoid construction and double break, silver alloy contacts for their lower starter ratings, because experience has proved this construction superior to any other. Therefore, wouldn't this experience repeat itself with the higher rated starters?

Allen-Bradley has found this to be absolutely true. Its starters of high hp rating are regularly establishing new standards of starter performance. As you go from size to size, the operating characteristics remain the same—you get trouble-free, long-life performance.

Standardize on Bulletin 709 solenoid starters—they are Tops in Quality!

A row of A-B 350 hp Bulletin 761 automatic slip ring motor starters with circuit breaker disconnects in the Milwaukee sewage disposal plant.

Allen-Bradley Bulletin 798 multi unit control center used with motors ranging from 10 to 75 hp installed in a southern Kraft food plant.

ALLEN-BRADLEY STARTERS FOR LARGE A-C MOTORS ARE AS POPULAR AS THE BULLETIN 709 SIZE 1 FOR SMALL MOTORS

Allen-Bradley manual and automatic starters for large squirrel-cage, slip-ring, and synchronous motors—both high and low voltage—have earned the same reputation for "Quality" for which the lower ratings are known. Every operating requirement can be satisfied, either with individual units or as sections of a multi-unit control center.

Allen-Bradley high voltage starters are rated up to 1500 hp with voltages ranging from 2000 to 4600 volts. The high voltage, synchronous motor starters are self-protecting against short circuits up to 250,000 kva on 2501-4600 volts, 3 phase, 60 cycles. Oil or air break switching available. Please write for the Handy Catalog.

THE LINCOLN ELECTRIC COMPANY

Dept. 1615, Cleveland 17, Ohio

*Creating lower costs for industry
...with welded steel*

The Champion is a feather-weight van built for heavy-duty service. For extra strength Airco welding rods, Easyarc 12 and Airco 387 electrodes are used exclusively to join the tough-but-light

tubular steel frame. Faster, more economical production was also achieved through the use of Airco Heliwelding equipment, cutting torches and accessories.

4 Airco products help put new champion on the road —lighter by one thousand pounds!

The Dorsey Trailer Company, Elba, Alabama, wanted to cut the weight of its vans by a thousand pounds — without cutting durability or strength. An aluminum and tubular steel design solved the first part of the problem. The selection of Airco products for the all-important welding job neatly took care of the rest.

From planning to production you can rely on

assistance — and completely unbiased recommendations — from Airco Technical men. For Airco is the leading supplier-manufacturer of all kinds and every type of welding and flame cutting processes, their controls, supplies and accessories. Write to Airco for free literature describing Heliwelding equipment and Airco electrodes.

Carpenter **PVC** pipe and fittings for cost-saving corrosion control

● Here is a new Carpenter service to help processing plants cut piping costs for handling a wide variety of corrosives under moderate operating temperature and pressure conditions. Carpenter PVC Plastic Pipe and Fittings are admirably suited for such piping requirements because of the excellent corrosion resistance, strength and other desirable properties of the unplasticized polyvinyl chloride from which they are made. They withstand both oxidizing and reducing conditions. For this reason, Carpenter PVC Pipe and Fittings supplement other corrosion-resistant piping materials previously made available by Carpenter research and production advances in stainless and specialty steels.

Two types of Carpenter PVC Pipe and Fittings are available—No. 1 provides outstanding chemical resistance along with high strength, toughness and rigidity. No. 2 provides high impact strength and excellent corrosion resistance. Both types are available in eight pipe sizes of 1/2" to 4". Pipe is made in Schedules 40 and 80. A full line of Schedule 80 threaded and socket fittings is available.

Easily and economically installed with usual piping tools, Carpenter PVC Pipe and Fittings assure trouble-free service with cost economy. Why not look into the advantages of using Carpenter PVC piping systems in your plant? Consult your nearby Carpenter Distributor or Representative and ask for new Technical Bulletin T.D. 119.

The new Brownhoist Wagon-Cranes are specifically designed to do an outstanding job wherever high mobility and high capacity are required. You'll see them at work performing heavy duty jobs in mines, quarries, steel mills, for railroad and lumber operations and for many other large industries. Equipped with dynamatic clutch, anti-friction bearings at all essential points, power steering, electric travel and electric rotation. Mounted on a 12 wheel crane carrier capable of speeds up to 8 miles per hour, the unit can be operated by one man from easy-to-reach controls. Economical to operate. Available in capacities from 25 to 60 tons. For specification folder or further details, get in touch with our nearest representative or write us at Bay City.

There is no adequate compromise with efficient production practices, if you are in business for a profit.

But you don't always know just how competitively efficient your equipment is. Case histories of what the other fellow is doing are sometimes garbled. At least the poor ones are not advertised. And conditions vary in all plants. Sometimes you have reason to be more concerned with what you don't want in new equipment than with what you do want. Cone believes too much is at stake for a machine to go into a line unequipped for the job, with either carbide or hss tools.

The Conomatic Carbide Development treats each job individually from standpoint of work, machine, tools, and operating personnel.

PLEASED WITH PLYMOUTH'S

steady pull and power

—So says Gilbert C. Rieck, Internal Transportation Foreman at the George J. Meyer Manufacturing Co., Milwaukee, Wis.

The world's largest manufacturer of bottle cleaning, filling, pasteurizing and labeling equipment for the bottling industry has only good things to say about their new Plymouth Torqomotive. Shown above hauling crated bottling equipment, this 9-ton model replaced an 8-ton Plymouth Locomotive used for sixteen years at their Cudahy plant.

"Our new Model DGT Torqomotive has new Plymouth features which have definitely increased hauling efficiency," reports Mr. Rieck. "It operates about 36 hours weekly over our 1½ miles of track, and has helped us realize substantial savings over our previous 8-ton model. Fuel consumption averages only 1½ gal-

lons a day. Our operators are mighty pleased—especially with the *power and steady pull* resulting from Torqomotive Drive!"

The effortless, economical operation of Plymouth's powerful Torqomotive Drive can mean a big difference in your operation. Get more detailed information on this unique transmission. Latest bulletin will give you the facts on models from 3 to 70 tons, Gasoline or Diesel, mechanical and Torqomotive Drives*—also Diesel-Electrics. Address: Dept. A-1, Plymouth Locomotive Works, Division of The Fate-Root-Heath Company, Plymouth, Ohio.

Tunnel within a tunnel — 8500 ft. exhaust ducts are supported by seven-foot Monel hangers. along the top of each Holland Tunnel tube There's one every eight feet along the duct.

The Holland Tunnel that drivers never see

Drivers never see *this* tunnel because it is hidden above the ceiling—a tunnel within a tunnel.

It's part of a unique air exhaust system that completely changes the air in the Holland Tunnel every minute and a half. Since the famous tunnel connecting New York and New Jersey was opened in 1927, the system has proved so successful that designers of the Lincoln and other large tunnels have adopted it.

In working out this unusual exhaust system, Port of New York Authority engineers faced the problem of providing support for the tunnel ceiling, or — more correctly — the "exhaust duct floor." In order to minimize wind resistance, hanger rods from the tunnel shell to the duct floor had to be as thin as possible.

The answer — Monel nickel-copper alloy!* The strength of Monel alloy — plus its corrosion resistance — enabled the engineers to use hangers of minimum cross-section without requiring any allowance for corrosion.

A recent check showed these thin Monel hangers in as good condition as when installed. *No corrosion after 28 years, despite dampness and the high concentration of corrosive engine fumes in the exhausted air!*

When you have a metal problem, one of the Inco Nickel Alloys may be the answer to it. These alloys are all

strong and tough. They can help you reduce weight . . . protect product purity. They can provide improved resistance to corrosion . . . or greater ability to withstand heat.

Write for "Standard Alloys for Special Problems." This booklet summarizes the properties, applications and available forms of all the Inco Nickel Alloys. You'll find a copy helpful in selecting the right metal for *your* job.

And, of course, we're always glad to work with you on problems. Don't hesitate to call us in.

Metalworking Outlook

Economic Profile

Business for the next six months will go along much as it has in the first three. The upturn will come in the last quarter, led by autos. The FRB industrial production index thus far this year has averaged 143, compared with 139 last year. Look for a 145 average in 1956. Gross national product thus far is running at a \$400-billion annual rate, compared with \$387 billion last year. Expect GNP to hit between \$405 billion and \$410 billion in 1956. After-tax corporate profits this year should reach \$23.5 billion, compared with a \$22.4-billion annual rate achieved in the fourth quarter of 1955. Prices will continue to edge up.

Labor Notes

The International Union of Mine, Mill & Smelter Workers will demand a uniform general wage increase of 20 cents an hour, jobless pay and a number of fringe benefits in negotiations for new contracts this year . . . Steelworker President David McDonald's blast at U.S. Steel Corp.'s annual earnings report is a standard prenegotiation procedure. The union statement errs in saying that the increase in the tin plate price is effective Apr. 1. The date is Apr. 30.

Navy To Replace Tools

Of the Navy's 145,000 machine tools, 2 per cent are more than 15 years old; 38 per cent are between 10 and 15 years old; 3 per cent are between 5 and 10 years old and 57 per cent are less than 5 years old. Assistant Air Force Secretary Dudley C. Sharp told machine tool builders meeting in Houston last week that the Navy will start a new replacement program. Tools bought before 1941 will be disposed of if they need repair. Tools bought from 1941 to 1946 and requiring 25 per cent or more of their acquisition value for full repair will be disposed of. Tools bought after 1946 that require 35 per cent or more of their acquisition value for repair will be disposed of. A repair ceiling of \$3500 per unit has been set. Some \$70 million has been authorized this fiscal year for starting this modernization program. Watch for a continuing program.

Tool Orders Slip

New orders for machine tools in February totaled \$86 million, 25 per cent lower than the \$115.2 million recorded for January but still 39 per cent higher than the totals racked up in 1955's February. Executives in the industry and in the National Machine Tool Builders' Association are not alarmed by the drop in February. Shipments for the month rose to \$64.6

Metalworking Outlook

million from \$54.6 million in January. The February totals were 30 per cent higher than shipments for the like 1955 month.

Storm Over Exports

Senators are kicking up a storm about Free World shipments of strategic materials behind the Iron Curtain. Involved are machine tools, generators and turbines, diesel engines, copper wire, aluminum and its alloys, nickel alloys, molybdenum alloys and magnesium. Sen. John McClellan (Dem., Ark.) heads up a Senate subcommittee checking into the matter. The controversy could affect the fate of the President's \$4.9-billion foreign aid program and the export control act, coming up for extension June 30. Administration men claim: The problem is that our allies need export markets to survive; all the U.S. can do is try to persuade them not to ship certain products.

Atomic Matters

Bethlehem Steel Co.'s shipbuilding division has a Navy contract to conduct design studies on a nuclear propulsion plant for a surface warship in the 8000-12,000-ton range . . . The Atomic Energy Commission has finished reviewing 30,773 research and development reports. Results: 10,916 were declassified; access-permit holders can look at 14,157 reports still classified as confidential or secret; the remaining 5700 reports will be withheld because of their relation to weapons or military propulsion reactors . . . The Navy's atomic objective: Atomic propulsion of all major combat ships sometime in the 1960s.

Research: More, More

Some \$5 billion is being spent this year on research in the U.S., \$3 billion of it in industrial labs. Union Carbide & Carbon Corp.'s David Swan says that for every \$1 billion expended in industrial research, from \$5 billion to \$20 billion must be invested as capital to take advantage of the results.

To Buy a Ford

An average wage earner can buy a new Ford with 26 weeks' pay, says Ford Motor Co.'s R. J. Eggert. That compares with 31 weeks' pay in 1949 and 1941. He predicts consumer buying of all goods will hit a record \$262 billion this year, 4 per cent of which will be for autos.

Aid for Small Business

Proposed U.S. contracts worth more than \$260 million were reserved for exclusive competitive award to small firms during the first eight months of this fiscal year, says the Small Business Administration. That's \$18 million more than was reserved in the corresponding period of last fiscal year. In the first eight months this fiscal year: Prime contract referrals were made to small firms resulting in more than \$198.3 million in contract awards; procurement counseling and aid were provided to 14,166 small companies; prime and subcontract opportunities were referred to 64,322 small firms.

look at the

EXTRA STRENGTH

in these gears

Notice how the teeth are continuous across the face of each gear in the photo? That is a characteristic of Farrel herringbone gears, which, instead of a useless center groove, have a *backbone* where the helices meet. This puts the entire face width of the gear to work for you. It pays off in *extra strength* and greater load and shock capacity—in smaller space.

The answer lies in the unique method of manufacture. The machines that cut Farrel gears—famous Farrel-Sykes generators—make continuous tooth herringbone gears. The center groove required for tool clearance by other machines is replaced by useful working tooth area.

Backbone comes in any size up to 23 feet diameter—for virtually any application. Ask for details.

FARREL-BIRMINGHAM COMPANY, INC.
ANSONIA, CONN.

Plants: Ansonia and Derby, Conn., Buffalo and Rochester, N. Y.

FB-1070

This comparison shows the greater tooth area of the Farrel continuous tooth herringbone gear (left) which gives it greater strength than the double helical gear with center groove (right).

Farrel-Birmingham®

Type 431 Stainless

Armco 17-4 PH

Stainless steel discs hardened to Rockwell C40 to 41 looked like this after heat-treating.

How Armco 17-4 PH Stainless Steel cured these heat-treating headaches

These parts were causing plenty of headaches for heat treat and the rest of the shop until they were made of Armco 17-4 PH Stainless Steel.

High temperatures required to harden grades formerly used caused severe distortion. This meant heat treat was saddled with costly, time-consuming straightening operations—plus the job of removing heavy scale.

Armco 17-4 PH eliminates these shop headaches. Distortion and scaling don't occur because this unusual high strength stainless steel can be fully hardened by heating at only 850 to 900 F for 1 hour and air cooling. With this low-temperature heat treatment, parts remain within toler-

ances and have only a light heat-tint discoloration.

These cost-cutting advantages also mean that you usually can finish-machine Armco 17-4 PH stainless parts before heat treatment. You don't have to reroute to the machine shop for finishing in the hardened condition.

If you are making hardened parts for corrosion resistant applications, Armco 17-4 PH Stainless Steel may help you cut costs and boost production.

Write us for complete information on this special easy-to-harden stainless steel. It is available in billets, bars and wire. Also ask about Armco 17-7 PH Stainless—produced in sheet, strip, plate, bars and wire.

April 2, 1956

Investing in Steel's Growth

The steel industry earned more than a billion dollars in 1955—a new high for dollar earnings, although profits as a percentage of sales have been higher.

In coming weeks you can expect to hear much about steel earnings. Labor unionists, coming to the bargaining tables, will make much ado about them.

Steel consumers, facing the probability of higher steel prices by midyear, will grumble.

Some of the discussion will be more emotional than factual. But the facts deserve serious and dispassionate study by all metalworking people.

Steel is in short supply even though operations are at practical capacity. We have had steel shortages during many of the postwar years. Any time shortages have been acute, we have had interference with manufacturing operations, unemployment and other dislocations. Gray markets and premium prices have appeared, and the consumer has paid more for end products.

Steel capacity must be increased by about 20 million tons during the next five years. The cost will be about \$4 billion. Then we will need to build still more capacity, and the cost will be much higher. It will involve new plants costing four to five times as much as existing capacity.

Where will the money come from?

There are three possible sources: Depreciation recovery, now inadequate because it does not account for inflation; borrowing or sales of securities; or larger profits to reinvest in the business. Realistically, funds will have to come from all three sources.

Ernest T. Weir, National Steel Corp. chairman, presented the case for steel producers before the New York Security Analysts. When National's present expansion is completed, he indicated its next project will be a new 2-million-ton plant, costing a minimum of \$650 million. "National certainly cannot go out on the market and finance the full \$650 million . . . the best we could expect to do through the sale of securities would be to raise \$400 million. This means that when we start building the plant, we must have accumulated against this project the sum of \$250 million . . .

"This simply cannot be done on the present earnings basis . . . there is one answer and one answer only . . . the selling price of steel must be advanced materially."

The situation is analogous to the highway program. We all want more and better roads. The expense is heavy. If we want adequate highways, we'll have to pay for them.

If we want an adequate supply of steel, we will have to pay for it.

Walter J. Campbell

"Quality" is an Important Word in the Purchase of WASHERS, too

Never before has Industry, as a whole, been more conscious of Product Quality than in today's competitive market. In the final analysis, no piece of equipment is any better than its smallest, least noticed components, such as WASHERS... essential to secure, permanent *fastening and holding* of vital parts.

In the manufacture of Milwaukee Wrot Washers, *uniform high quality* is a production policy that is strictly adhered to and maintained... and yet does not involve a cost penalty to the purchaser. You get the best the market offers, competitively priced, plus assurance of a dependable source of supply... when you specify "MILWAUKEE WROT WASHERS"... standard and special washers of every description, in all sizes, with over 100,000 sets of dies available to meet your specifications.

Send us your specifications and let us quote on your requirements for washers and stampings of every kind.

Skilled Workers Restless

The shortage of skilled labor is the basic cause of much job hopping and other signs of dissatisfaction. Here are suggestions on what to do about the problem

"PIRATING among companies—the old law of supply and demand—that's creating most of the skilled labor problems."

So charges a disgruntled Cleveland personnel director. He explains: "We're not losing skilled men because of a wage differential; it's because we're not working overtime at the moment. Busy small companies come along with six-and-seven-day-work-week offers, and the men grab at them."

Symptom — In Michigan, the Society of Skilled Trades is attempting to form a skilled workers' union by luring members from the United Auto Workers. Its charge: UAW hasn't taken care of the skilled worker—the wage gap between nonskilled and skilled labor continues to narrow; the recent Supplemental Unemployment Benefit contracts took 5 cents out of the skilled pay envelope.

Skilled workers are getting restless; many firms report above-average

turnover that's increasing monthly—particularly in the higher skills, such as toolmakers and die sinkers.

Cause—But are narrowing pay differentials the primary cause? Most industrial relations experts say no. Wage rate comparisons—particularly in the auto industry—bear them out (see table on page 54). The differential between a sweeper and toolmaker in 1940 was 36 per cent; today, it's 34 per cent. But the differential between an assembler and a toolmaker has increased from 24 to 26 per cent in the same period.

The real crux, most feel, is the shortage of skilled labor. A vice president of a major midwest equipment maker says: "The skilled labor situation is getting worse, though it's not yet as serious as the problem of getting and keeping engineers." These factors are compounding the problem: Lack of apprentices, technological develop-

ments, industrial expansion.

Proof—Take a look at some of the Labor department statistics: In January there were nearly 5000 skilled metalworking job openings listed with state unemployment agencies. This compares with about 2000 similar openings a year earlier. Bear in mind, too, that these figures probably are considerably below demand. Public agencies do not hold orders for all job vacancies in their areas.

Who's pinched the tightest for skilled labor? With few exceptions, loudest complaints come from companies with no apprentice programs. But even firms with the best programs have trouble keeping pace because of plant expansions and loss of men through turnover.

Training — Thompson Products Inc., Cleveland, for example, is stepping up both its learner and apprentice programs. On one project alone, 100 new Bullard Manitrol operators are being trained.

Says Theodore Haas, Thompson's director of training: "Both management and labor are inclined to view the skilled labor problem apathetically. We should be training a minimum of one apprentice for every ten journeymen."

One of the auto companies feels its skilled labor requirements for the future necessitates one apprentice for every five journeymen.

Justified—To the claim by many companies that apprentice programs cost too much, proponents counter: Figure your hiring costs, lost production or overtime paid to others to get the work out and you'll find it's a pretty good investment.

Some claim difficulty in finding qualified apprentice applicants. Says a Detroit vice president: Set up a good program and you'll have little trouble. We have 42 applicants for four die model building openings; 131 applicants for 51 electrician apprenticeships. We are short in the toolmaker classification, but even here we had 59 applicants for 69 openings.

Technological developments are important in the skilled labor problem. Not only will the ratio of skilled workers in the work force

be increased, but the skill requirements will change.

Future Needs — Automation in the auto industry already is stepping up the skilled worker ratio. One automaker reports that its skilled labor ratio has increased from 6 to 10 per cent of the total hourly work force. Another predicts that 15 or 20 per cent of the industry's work force will be skilled in the future.

Greater complexity of equipment demands greater skills to repair and maintain it. Paul Minsell, director of industrial relations at Eaton Mfg. Co., believes that the next 15 years will be an era of more combined skills to meet the technological changes. Chrysler

phase, but the background is necessary if he is to be effective in his job.

Don't look for an improvement in the skilled labor situation in the short term. You can calm some of the unrest by staying away from the Ford-type SUB and by granting percentage increases or skilled wage differentials in your contract negotiations. But the real answer is getting more men into the skilled labor force—through your own apprentice programs.

Engineer Shortage

ASME head says problem starts in grade schools and comes to a head in the high schools

AMERICA's shortage of engineers and scientists will grow more acute because of the demands of automation, says Joseph W. Barker, president, American Society of Mechanical Engineers.

He says there is no national answer to improving educational standards but cites measures found successful in some communities:

1. Use of teacher aides.
2. Sharing of faculties in smaller high schools.
3. Industry co-operation.
4. Use of active engineers as teachers on a part-time basis and retired engineers on a full-time basis.
5. More realistic pay scales.

A Change—Dr. Barker suggests that mathematics and science teachers should be paid more than teachers not in demand by private firm. He declares: "I admit that it would create certain personnel

difficulties if you paid more to a teacher of chemistry than you did to a teacher of French. The simple truth, though, is that industry is not offering large salaries to teachers of French. The educational system is not immune to the laws of supply and demand."

Part of the trouble in the schools, he states, is that children of school age now are part of the baby boom of the 1940s, while many teachers must be drawn from the small generation of the 1930s.

Russians Ahead — Dr. Barker places America's shortage of engineers and scientists at 50,000 and notes that over the last 25 years Russia has reportedly turned out three engineers for every two of ours.

Enough Columbium, Tantalum?

Columbium and tantalum both on scarce list in the U.S. since before the Korean War, are in sufficient supply to meet all known civilian uses, the Bureau of Mines believes.

The metals are especially vital for jet engines and special electronic equipment. In everyday uses, they go into new steels and a variety of products, ranging from camera lenses to fountain pens. Possible new civilian and military applications, retarded by wartime conservation, now may be developed.

Companies that produce metals from columbium and tantalum ores informed the Bureau of Mines that they can handle all demand. In fact, they say they could produce three times the amount of columbium being consumed for civilian uses.

Last year, domestic consumers, including the Armed Forces, used less than half of the more than 5000 tons of columbium and tantalum mineral concentrates available, so the government stopped purchasing these minerals last May.

Columbium and tantalum are produced principally as by-products of tin mining in the Belgian Congo, Malaya, and Nigeria. The latter furnished the U.S. with nearly 60 per cent of the more than 9 million lb of columbium imported in 1955. Some 2 million lb of tantalum were brought into the U.S. last year.

• Extra copies of this article are available in quantities from one to three until supply is exhausted. Write Editorial Service, STEEL, Penton Bldg., Cleveland 13, O.

Corp. currently is conducting educational programs in industrial electronics, electricity and hydraulics to bring its journeymen up to date with the increasing complexity of its machinery.

Your Program—Apprentice programs should be geared to those requirements. The aircraft and guided missile industry already faces the problem. A case in point: Aircraft mechanic apprenticeship. In addition to the usual machinist's training, the apprentice gets training in electrical and instrument maintenance and repair, hydraulics, welding and interior fitting work. True, the apprentice probably will become a specialist in only one

mobile trim and frames of trucks.

Less Expensive — In discussing costs, Mr. Barron explains that in a unit requiring 1/16-in. stainless steel, the stainless sheet would cost about 83 cents a pound. A titanium sheet would cost \$15 a pound, nearly 18 times as much.

But titanium weighs only 56 per cent as much as steel. On this basis, the cost factor here for titanium would drop ten times, he points out. Because raw material represents only a fraction of the cost of the finished assembly (assuming 20 per cent in both stainless and titanium), a piece of titanium equipment can be three times cheaper than one made from other materials.

"Obviously, every day of increased service life beyond this price difference is of direct economic benefit," Mr. Barron asserts.

Time Saving—Another important feature for end users, he says, is reduction of down time costs during replacement. He gives this example: Titanium replaced Type 309 stainless in a thermowell installation in high-temperature nitric acid service. The stainless unit cost about \$95 and lasted six months. Its replacement cost, including down time and labor, amounted to \$1250. The titanium thermowell cost \$300, but it has a service life estimated at five years. "There was no hesitation in making the titanium installation," Mr. Barron declares.

What's New—Among other new uses for titanium, Mr. Barron discusses these:

1. Steam jet diffusers used to create process vacuum are subject to corrosion by high velocity steam and dilute hydrochloric acid. Original diffusers were made of cast iron and had to be replaced every three months in one installation. Three years ago, titanium diffusers were installed, and after continuous service, they still are in operation, with no sign of corrosion.

2. The exceptional resistance of titanium to sea water and marine atmosphere makes it excellent for marine uses, such as dockside equipment, sea water valves and intake screens. Titanium also will find use in the distillation of fresh water from sea water.

"In many uses, under extremely corrosive conditions, titanium has far outlasted conventional metals, in one application by a ratio of more than 1800 to 1," Mr. Barron reveals.

Important Property—This chief property — corrosion resistance — is of great significance in nondefense applications and is of possible greater importance in the long-range future of the metal, Mr. Barron adds.

Another important property, titanium's strength-weight characteristic, indicates a good future in lightweight passenger trains, auto-

More coils like this may be going to industrial markets as . . .

Titanium Hunts Civilian Uses

LIGHTWEIGHT passenger trains, trailer-truck frames and ship plates —all using titanium—are forecast by Leo J. Barron, a Du Pont metallurgist.

He told a meeting of the American Association of Mining & Metallurgical Engineers that although many of titanium's uses are being restricted by price levels, the metal is being employed frequently where resistance to corrosion is vital.

Civilian Markets—Du Pont has a development program which ranges from chemical and food processing equipment to marine hardware for sailboats.

Make Sales Dollars Pay

The formula: Identify major accounts, so salesmen don't waste time with those having little potential; set your quotas; establish a rating system of sales performance

THE SALESMAN leaned his brief case against a chair leg and let his eyes canvass the reception room of Wenevrybe Inc. He always enjoyed calling there. The main office building was less than five years old and fitted out with all the accommodations of a modern business . . . air conditioning, comfortable waiting rooms, a really fine coffee shop. And the people were pleasant. He caught the eye of the receptionist. "I'm sorry, sir, Mr. Ucantellmi is still in conference."

The salesman lit his sixth cigarette in an hour. Thoughtfully, he picked up his brief case and began to thumb through old orders from Wenevrybe: Ten orders totaling \$10,000 in the last year. "Let's see," he thought, "the home office tells me I have a million-dollar territory. Now how many times did I call on this outfit to sell them \$10,000 worth of goods?"

Major Accounts — Prodded a little by his hour's wait in the reception room of Wenevrybe, the salesman was about to exercise a little sales control — something that should have been taken care of months before by his sales manager; something that can be overlooked easily by management in its efforts to keep the salesmen making calls.

Reynolds Metals Co. found out after World War II that 10 per cent of its aluminum customers were accounting for 80 per cent of sales. Reporting to the National Industrial Conference Board, David P. Reynolds, vice president of general sales, said: "Our salesmen were spending a large part of their time working with accounts that did not have major potential, at the time, or for the future."

Hurt Distributors — One result of Reynolds' analysis was the discovery that it was hurting its own distributor organization, which was set up for the explicit purpose of handling small orders.

The smaller customers were hurt, too. Better service and deliveries than the central office could offer were available to them through distributors.

Identification of major accounts is the first step to effective sales control. Reynolds combined field information with marketing reports to learn how much was being sold where, and what the future requirements might be.

Salesmen's time was freed to work on major development projects—with the people who didn't use aluminum, but would buy in quantity if they did.

Simple Target — Sales quotas, Robert M. Evans, general sales manager, Talon Inc., told the

NICB, may take many forms, all of which must be linked to the salesman's compensation.

There are three basic ways to set a simple target: 1. Based on the potential of a territory. 2. On the salesman's share of total company production. 3. On the volume necessary to reach a break-even point.

Talon pays a base salary plus The plus must be a sufficient proportion of a salesman's earnings to provide proper incentive. Quotas are revised quarterly—a flexibility that enables Talon to account for general economic forecasts, introduction of new products, advertising and sales promotion.

Sales Performance—Three comparisons can be made to answer "how are we doing?": 1. How you compare with the industry as a whole (per cent of industry volume). 2. How your results compare with your goals. 3. How your performance compares with how you did in the past.

Elmer G. Rahe, vice president-sales, Globe-Wernicke Co., told NICB that those comparisons should be followed with a personal analysis of the salesman (see check list). The percentage of potential is the most important item, and is based on the territory's total market after a breakdown by states, counties, cities or whatever divisions are applicable.

A simple rating system from one to ten can be devised for the other factors on the check list, with the sales-expense ratio given in terms of the salesman's ability to stay within his expense account.

New Boat Doubles Speed

A speed of 26 knots was clocked by the *Solar Meteor* (a gas-turbine-powered boat) on its first demonstration run.

The craft is a joint project of the U. S. Navy Bureau of Ships and Solar Aircraft Co., San Diego, Calif. It is a standard, 40-ft, Navy personnel boat fitted with a 500-hp Jupiter engine.

The variable-speed, gas-turbine engine hits the scales at about 1000 lb, less than a quarter of what a comparable marine diesel engine weighs.

Check List for Your Salesman's Performance

- Percent of potential sales obtained
- Sales-expense ratio
- Job knowledge: Prices, products, policies
- Personal characteristics: Appearance, energy, initiative, attitude
- Ability to manage
- Home office relations
- Customer relations

Both government and industry can benefit by eliminating . . .

Waste Through Duplication

THE GOVERNMENT's war on waste by duplication has fixed many standards which are tested and ready for use by private industry. Continued co-operation between government and industry to reduce the number of items purchased by the government can be expected.

That's the progress report on federal standards given to the National Electrical Manufacturers Association by two government spokesmen: Roger E. Gay, director, Cataloging, Standardization & Inspection, Office of the Assistant Secretary of Defense (Supply & Logistics), and Willis B. MacLeod, director, Standardization Division, Federal Supply Service, General Services Administration.

Co-operation—NEMA members were urged to develop product standards more suitable for government use in purchasing electrical equipment. Problems of special concern to the government: designing from a wide choice of standard components; development of standards for high-mortality parts.

Mr. Gay indicated electric motors and generators as products containing high-mortality parts for which standards are especially needed.

Industry Standards — Government use of industry, technical society and trade association stand-

ards "is the smart and economical thing to do," Mr. MacLeod said.

Other organizations contributing to government standards include American Standards Association, American Society for Testing Materials and Underwriters' Laboratories Inc.

Cataloging — The Defense department's cataloging program (STEEL, Feb. 27, p.76) is establishing a uniform language for supply items within the Armed Forces. By last December 2.2 million items were identified under the system; another 700,000 will be included by the end of 1956. Complete conversion to the new system will be completed by 1959.

Civilian cataloging is moving along, too. Congress has supplied funds for the cataloging of 28,000 GSA and federal supply items this fiscal year. Another 102,000 will be cataloged next year if Congress appropriates funds.

Civilian and Defense department efforts are co-ordinated to achieve a uniform catalog. Mr. MacLeod pointed out that some 770,000 civilian agency items remain to be cataloged, if the system "is ever to be really effective."

Example—The government buys nearly 3 million different items, but some of the differences are trivial—for government purposes needless and expensive.

Savings achieved in one year will

exceed many times the cost of developing the standard. Elimination of half the government's supply items may be achieved through the cataloging and standards systems now being adopted.

Industry Use—Of the more than 3600 federal specifications and standards, many are perfectly suitable for widespread adoption by private industry, Mr. MacLeod said.

Insuring the Atom

Government may backstop private companies in covering atomic reactor risks

YOU ARE SUED as a result of an accident in an atomic reactor using your components. Are you covered by insurance?

It looks like the answer will be yes. But many details are still to be settled. Here's how the broad outlines shape up: Private insurance companies will cover day-to-day claims. The government will backstop them to protect against major disaster.

Consensus — These are conclusions of preliminary reports made by Columbia University for Atomic Industrial Forum Inc., New York, and by a group of ten insurance executives for the Atomic Energy Commission.

The AEC's study group says stock casualty and mutual companies are setting up funds that will give a pooled coverage of \$65 million for third-party liability, and that another \$50 million facility is being organized to cover physical damage to plant.

Problems—Rates will be hard to set, since there is little experience on which to base them. The AEC report suggests that they may be determined for each installation, depending on reactor location, purpose, power level, etc.

"Probability of a catastrophic reactor accident is small," notes the Columbia team. "But under existing legal rules, the reactor operator (and reactor component makers) could be subject to tort liability far beyond anything we've so far experienced." Its conclusion: Private firms cannot handle the job alone.

Auto Sales

In 1956 . . . 6.5 million
Avg, 1956-1958, 6.75 million

Estimates by McDonnell & Co.

Steelways

Autos Show Strength

Passenger car sales will run between 5.8 million and 7.8 million annually for the next three years. The fate of the Independents may not be changed by an antitrust action

WITH NEW MODELS a little more than six months away, the automotive industry isn't as bad off as it was supposed to be. Dealers are optimistic about spring sales, and expect an orderly model clean-up to follow during the summer and early fall.

New car sales this year should be between 6.4 million and 6.7 million, down about 9 per cent from 1955, says McDonnell & Co., New York brokerage firm. A million trucks will be sold, about the same as last year.

Production of passenger cars will be down 20 per cent to between 6.3 million and 6.5 million. Truck production will continue at about 1.2 million. Lower sales and production have been expected this year; however, these estimates represent strength not previously hoped for by some experts.

Forecast—From 1956 through 1958 the American public should consume an average 6.75 million cars a year. That's a gain of 8 per cent over the 1953-1955 period.

In any one year from 1956

through 1958, sales could range from a low of 5.8 million cars to a high of 7.8 million.

Buick Pressure—Typical of the strength of the auto market this year is the Buick. It's putting plenty of pressure on other medium priced cars like Pontiac, Mercury and Dodge, and the Buick Special is making itself felt in competition with the higher priced Chevrolets, Fords and Plymouths.

If the '57 Buick is as new as some people think it will be, its share of the market will continue to grow in all price brackets.

Antitrust Action—When Hercules fought the many-headed Hydra, he was dismayed to see each head he cut off succeeded by two more. If the government pushes an antitrust action against General Motors Corp., McDonnell & Co. suggests that Buick and Chevrolet, as Independents with the same dealer organizations they have, might take an even larger share of the new car market. So there's the chance that neither Ford nor Chrysler would favor a GM split.

Whether such a split will aid the Independents is also doubtful.

No one is ready to deny that both American Motors Corp. and Studebaker-Packard Corp. face serious trouble in the next two years. The advanced look of the Studebaker has given way to the Detroit look, and it appears unlikely a higher priced Studebaker can compete directly with the regular products of the big three, McDonnell & Co. says.

American Motors may have dumped all its eggs in one basket—the Rambler. It's a guess that the American public is ready for a second car to replace the lawn mower in the two-car garage. Will the wife take to the smaller variety, or want the more luxurious kind, only a year or two older?

Race for First—This year Ford and Chevrolet continue to lead the pack in total sales. GM says Chevrolet is having its best year, and McDonnell & Co. predicts the division will end the year with more than 25 per cent of the market.

Ford car sales are down about 15 per cent, and it now is accounting for 20 per cent of the market.

in the Balance

Metalworking exports show the way as Britain struggles to pull trade balance out of red

ALTHOUGH Britain's balance-of-payment problems are far from solved, January figures show that the situation may be coming under control. The drain on dollar and gold reserves was \$207 million, lower than the rate for the first six months last year.

January metalworking exports rose to the highest levels ever. They rang in at close to \$300 million, up 4.5 per cent from the fourth quarter, 1955. Machinery and aircraft showed the biggest gains.

Auto Scene—Despite the much-publicized slump in British automotive production, some sectors of the industry are doing well in export markets. Guy Motors Ltd., Wolverhampton, has just taken an \$40,000 order for busses androlley busses. Shipment is to be made to Johannesburg, South Africa.

Some British observers feel that the auto cutbacks may be healthy. They already have taken some strain off the sheet steel market. British mills will be able to divert production into plate and structural steel, both critically needed for other export industries like shipbuilding and railroad rolling stock.

With their domestic and export contracts combined, rolling stock fabricators have enough orders for capacity operations through the next two years.

Expansion—Steel mills are going ahead with plans to put in new capacity. January's ingot and castings production was at an annual rate of 21.75 million tons, another new record. It's estimated that as much as 21.5 million tons of steel may be made this year, up 1.5 million from 1955.

Atomic Partnership

AMF Atomics Inc., a subsidiary of American Machine & Foundry Co., New York, has joined hands with Mitchell Engineering Ltd., London, to design and build nuclear power plants in the British

Commonwealth and other countries.

Says Gen. Walter Bedell Smith, chairman and president of AMF Atomics: "It's the first international agreement made by private industry to fulfill the promise made by President Eisenhower in his 'atoms for peace' speech."

Mitchell Engineering has been active in atomic energy since 1950. It's handling engineering and pipework for Britain's largest atomic power plant, and has other contracts in Portugal, Greece, Northern and Southern Rhodesia, South Africa, India and Australia. AMF Atomics will design the reactors and supply them and their components.

Other news in international atomics: General Electric Co., Schenectady, N. Y., has announced that it will supply the first atomic reactor to Spain. The 3000-kw facility will be used for research. It's to be built near Madrid for the Spanish atomic energy commission.

Underspending?

The U. S. government is spending \$400 million a year on economic aid. It should be spending \$1 billion.

That's the opinion of J. D. Zel-

lerbach, chairman of the Committee for Economic Development, New York.

Money would go to "approved development projects" in the Middle East, Southeast Asia and Latin America. Mr. Zellerbach thinks that \$1 billion a year is conservative. "Certainly it is not a sum which the \$400-billion American economy cannot take easily in its stride."

Trade Notes

West German companies will provide 60 per cent of the foundry equipment for Venezuela's integrated steel mill. West German engineers will aid the Italian prime contractors in final planning and in supervising construction. A Swiss corporation is building the power plant . . . Indiana Steel Products Co., Valparaiso, Ind., buys Hayward Tyler of Canada Ltd., a foundry in Kitchener, Ontario . . . Bucyrus-Erie Co., Milwaukee, will build a \$3.5-million plant, also in Canada . . . Georg, the Ruhr coal cartel, has finally succumbed. It's being replaced by three new independent marketing companies . . . Germany now has nine steel companies which each produce more than 1 million tons a year.

Oil Rig To Drill for Dutch Brine

National Supply Co., Pittsburgh, has shipped this oil drilling rig to Groning, in the Netherlands. It will drill brine wells to provide salt for Dutch chemical plants. Part of the equipment was made by National's British affiliate

Senator Humphrey aims at company officers, to put . . .

More Teeth in Antitrust Laws

THE CURRENT CROP of anti-trust bills running through the Congressional hopper has a new addition, this one from Sen. Hubert Humphrey (Dem., Minn.).

The bill would take action against corporation officials who authorize actions that constitute criminal violation of the antitrust laws (price fixing, price discrimination, exclusive dealing and others).

Penalties—Convicted executives would be liable to forfeit to the U. S. an amount twice their compensation during the period of the violation. The bill also provides that such officials may be enjoined from rendering any service to their firm or to a competitor (permanently or for a period of not less than 90 days) and from receiving any compensation during such a period.

Says Senator Humphrey: "It is my opinion that direct civil liability of responsible corporate officials would make the antitrust

laws more effective. It is one thing to fine a giant corporation for violating these laws; it is quite a different matter when the penalties may be imposed on an individual who is responsible for his corporation's policies and actions."

Reasons—Behind the bill is a record "barren" of fines and imprisonments for criminal antitrust violations. The senator points out: Courts and juries shy away from putting a criminal label on defendants, let them off too lightly. In 66 years of the Sherman Act only three men served jail terms. Fines in the last 12 months averaged only \$1294, compared with the maximum allowed of \$50,000. So far, only one fine has gone over the \$5000 mark.

Some antitrust subjects (mergers, for example) were left out of the bill because often the people involved don't know they have broken the law until the government hauls them into court. Some observers think the same problems

would arise in the case of some of the violations that the bill specifically aims to cover.

Capital Goods Exports Up

Shipments overseas of capital goods last year hit \$3.8 billion, almost 27 per cent of total nonmilitary exports. Responsible for much of the rise are construction, excavating and mining machinery, machine tools, engines, turbines and pumps. Transportation equipment and electrical apparatus also figure.

A stepped-up effort by business and government to retain export markets and open new ones would go a long way toward helping the Foreign Aid program meet the challenge of the Communists' economic warfare tactics, says Marshall M. Smith, deputy assistant commerce secretary for international affairs.

Meet Robert E. Williams: Now serving as director, Communications Equipment Division, Business & Defense Services Administration, he's on leave from Automatic Electric Co., Chicago. This is his second WOC tour; during the Korean War, he was for six months director, Communications Equipment Division, National Production Authority. He can be reached in Washington at Room 4033, Commerce department. Phone STerling 3-9200, ext. 4821.

Major Industrial Components

(% of respondents who added to inventories)

STEEL QUARTERLY SURVEY

* Estimates of respondents

Survey includes: Bearings, castings, hose couplings, cylinders, electrical equipment, fasteners, forgings, gears, mechanical rubber goods, screw machine products, springs and wire shapes, stampings, weldments

Trend To Build Continues

Buyers around the nation are braced for higher prices. Shortages continue but higher over-all inventories are the trend. Many think they'll be better off in three months

STEEL CASTINGS are hard to find. They head the most-wanted list of 20 per cent of the purchasing agents responding to STEEL's latest inventory survey.

A shortage of all castings (die, gray iron, malleable, nonferrous and steel) concerns one of three survey respondents. Other items giving plenty of delivery trouble are antifriction bearings, many kinds of electrical equipment and forgings.

Sixty per cent of the respondents are having trouble getting at least one of the major industrial components.

Consistent—STEEL's last survey (Jan. 9, page 39) reported 30 per cent of the buyers expected to

build inventories in the first quarter of 1956. Expectations for the second quarter are up slightly to 32 per cent (see chart).

As it was a year ago (STEEL, Apr. 4, 1955, p. 35), the percentage of respondents building inventories in the first quarter rose to 21 per cent from a fourth quarter yearly low of 15 per cent.

Expectations for building inventories run about 10 percentage points above accomplishments; so the second quarter should see at least 20 per cent of the respondents with higher inventories, unless more critical shortages develop.

Higher Prices—The feeling is general that prices will continue

to rise. Several buyers think this good reason to build inventories; expected hikes in steel prices this summer are being anticipated now.

A more hopeful view is expressed by a Clifton, N. J., buyer, who is accepting deliveries of components ahead of his steel supply "to avoid the rush if steel ever softens in supply."

Longer lead time also is creating a tendency to build inventories, although it's difficult to build if your current requirements are not being met, as is the case with 17 per cent of the respondents.

A Milwaukee purchasing agent reasons this way: "Components are comparatively inexpensive as far as the whole assembly is concerned, so larger inventories of smaller components are advantageous at this time."

Levels—The general level for all major industrial components is a 30-to-60-day supply. Exceptions to the rule are found among supplies of belting and hose couplings where 40 per cent of the respondents are carrying inventories in the 30-day-or-less category.

About 10 per cent of the buyers think their inventory positions are worse than they were three months ago; 23 per cent believe they have improved their positions.

Almost 45 per cent hope to improve their inventories in the next three months; only 5 per cent think they'll be worse off.

Minor Theme—Not all purchasing agents are plagued with shortages. Some have better supply lines than others; some have been buying for several months in anticipation of present and future shortages.

The minor theme of STEEL's survey is represented by the 16 per cent of respondents who expect to lower inventories in the next three months, and who think they'll be better off if they do it. Another 5 per cent expect lower inventories to maintain their present position, and at least 2 per cent fear higher inventories will worsen their position.

Better Off — Of those respondents planning to build, three of four believe they'll be better off three months from now. Geographically, this group is scattered.

Texas Electric welds two castings to make heat exchanger header

Steel Casting Sales Climb

A SALES INCREASE of 15 to 25 per cent is expected by the nation's steel foundries this year.

F. Kermit Donaldson, executive vice president, Steel Founders' Society of America, thinks shipments should run between 1.8 million and 1.9 million tons. He estimates member foundries will operate at 80 per cent of capacity. This is considered good for an industry that must maintain a big reserve for defense production.

Last year's marks indicate a firm base for this year's business. Production last year went up more than 60 per cent while unfilled orders more than doubled.

The trend is continuing. The

society says new orders in February were 98.2 per cent of capacity, while March production is estimated at 86.8 per cent.

Market Shares—This year the railroads are leading the customer parade. One large Chicago foundry is running about 50 per cent stronger than last year because the railroad equipment field is so active.

The next largest share of casting production is going to makers of general machinery and valves and fittings.

C. L. Snowdon Jr., president, Reliance Steel Casting Co., Pittsburgh, says: "Expansion of steel mills and increasing demand for

metalworking equipment are responsible for good sales."

Clyde L. Hassel, vice president Pittsburgh Steel Foundry Corp., notes that demand for heavy equipment is strong. But another Pittsburgh foundryman says there is a poor balance in orders among the many various sizes of castings.

Shortage Helps—The shortage of steel plates is causing a switch to steel castings, but pattern costs may hold back the change-over.

Foundries depending on truck production will do as well this year as last. But the slump in farm implement production seems to be affecting suppliers.

Something New — Expanding markets for steel castings are seen in turbines and generators. Other new uses are in guided missiles and the lift slab method of building construction.

The use of shell molding (STEEL Mar. 19, p. 97) bids to expand markets for steel castings. Ralph West, president, West Steel Casting Co., Cleveland, thinks that the process may be applied to 70 per cent of the castings weighing under 10 lb which need considerable machining.

Better sands and binders and improved molding machines get much credit for the improvement in casting properties. W. M. Ferguson, vice president, Texas Electric Steel Casting Co., Houston, says: "In our foundry we make castings to withstand pressures up to 15,000 psi. Ten years ago 500 psi was high."

Meeting — Howard F. Park Jr., vice president, sales, General Steel Casting Corp., Granite City, Ill., was elected president, Steel Founders' Society of America, at the annual meeting in Chicago, Mar. 19-20.

George W. Myers, president, Crucible Steel Casting Co., division of Consolidated Foundries & Mfg. Corp., Milwaukee, was elected vice president; and Royal G. Parks, treasurer, National Malleable Steel Casting Co., Cleveland, was re-elected treasurer.

Robert C. Wood, president, Minneapolis Electric Steel Casting Co., was awarded the T & O medal of the Steel Founders' Society at the annual meeting.

Screw Parts Sales Climb

Planning for Expansion

HOW DO you boost your dollar volume by 50 per cent or more in ten years?

The National Screw Machine Products Association thinks the job shop screw products industry has a chance of doing \$800 million in sales by 1965 (see table), a 60-per-cent increase from 1955, or probably about a 50-per-cent gain in physical volume when you allow for inflation that's likely to come.

Barnstorming—Top officers in the association, President Ernest W. Schneider and Executive Vice President Orrin B. Werntz, have been traveling among the members or the past year telling them that the goal can't be reached if the approach is like Topsy's. Says Mr.

Werntz: "We have to plan our gains, or they won't come."

Here's one NSMPA suggestion to plan that growth: Set aside 8 cents of every sales dollar for the next ten years to modernize and expand. In 1947, the latest year for which figures are available, the industry spent only 5.9 cents per sales dollar for new and used equipment and new plant. Since then, the figure has probably not been much higher.

Earnings—In 1954 the industry averaged only 4 per cent in before-tax profits. If the companies that had losses that year were left out, the industry showed profits of only 8 per cent before taxes, 4 per cent after taxes. While the 1955 per-

centages are a little better, they're still not high enough to make it easy to find that 8 cents.

How it can be found will be a major topic at the industry's annual meeting in Milwaukee this week. A series of nine workshop sessions at the meeting will explore aspects of the problem. Also, NSMPA is working on a marketing research roundup to help with the question of modernization.

Three Areas — Experts think modernization in the screw products industry can be accomplished through:

1. More and better training of administrative personnel, particularly the juniors who may be running the company in the 1960s. (Trade association seminars, college courses and business magazine articles should be used more.)

2. Closer attention to the problems of depreciation and re-equipment. (The Internal Revenue Service's liberalized depreciation rules can help, as can some of the newer scientific approaches to re-equipment policies. See STEEL, June 20, 1955, p. 99.)

3. A better profit ratio. (Needed to achieve this, among many things, are more economic selling, daily cost searching.)

Alternatives—What will happen to a company that doesn't choose to set aside 8 cents of every sales dollar for modernization and expansion? "There's no standing still in this or any industry," says Mr. Werntz. "You either move ahead or fall back or out. Too many companies in all component part industries don't seem to realize this."

He says that the "fall out" rate in the screw products industry in the last two years has been higher than at any time in the past decade. In the industry now are some 500 commercial shops with 20 or more employees. More than 1000 shops exist with less than 20 workers. Mr. Werntz thinks that ten years from now there will be fewer companies, but bigger ones.

Will this revised industry of 1965 be equal to a volume of \$800 million? It has been able to cope with growth thus far. Since 1929 its gross business has risen 328 per cent, compared with a rise in general consumer durables of only 155 per cent.

**HYATT HELPS
FIREBIRD II
SAVE FUEL!**

**Unique regenerator operates in 1300° F
exhaust on special HYATT Roller Bearings**

To enable the Firebird II to operate almost as economically as a conventional car, GM engineers designed a drum-type regenerator which revolves through the gas turbine exhaust, recovers 80% of its 1300° F heat, and transfers it to the intake air.

No ordinary bearings, however, could handle this job. So HYATT designed special roller bearings which operate efficiently and dependably in this punishing service. Just as dependably as do the millions of HYATT taper bearings which are used in nearly half the automobiles being built today!

Remember, HYATT is America's first and foremost builder of roller bearings—a major source of supply for the automotive industry. Hyatt Bearings Division of General Motors, Harrison, New Jersey.

Auto men strive to control costs, heed customer demands in . . .

Juggling for Quality

BUILDING automobiles and trucks at a high level of quality is a juggling job, say the engineers and quality control people who discussed essential versus nonessential quality at a recent Society of Automotive Engineers meeting in Cleveland.

Determining which parts must hold to design specifications and which ones can be used even though they don't meet tolerances is a problem that starts with suppliers and continues right through manufacturing, inspection, servicing and even the customer.

Theory—It's easy to say that parts must be rejected or manufacturing operations changed if specifications by engineers aren't followed. But the problem isn't that simple. Too many persons have a finger in the pie.

Sales departments are interested in matching competition. Suppliers may accidentally or deliberately slip through low quality parts which have to be used. Engineers can't anticipate all the answers, and what one customer calls essential may be unimportant to another buyer.

Example — The result is that brake drums which are slightly out of balance might get by, but cylinder heads have to be exactly to tolerances. The next time, these conditions can be reversed. Deciding when specifications are essential or nonessential pits quality control sections against design engineers and gives the automakers plenty of problems.

Robert Kenney, assistant chief inspector, General Motors Truck Division, says: "You won't get into trouble with a customer if you know about errors or omissions. Customers complain about the mistakes you aren't aware of."

Guinea Pigs—The industry privately admits that sometimes the customer acts as an unwitting guinea pig when he discovers flaws in a vehicle. Other times, owners of truck and auto fleets are asked to co-operate with the manufacturers to find out how a vehicle really works.

In either case, when complaints come in, the engineers have to move quickly to correct mistakes. Here are some of the checks companies apply to insure the best

possible quality in finished cars and trucks.

Suppliers—R. D. Long, chief inspector, Motor Truck Division of International Harvester Co., Chicago, points out three important factors in dealing with partsmakers.

1. A company must know and trust its suppliers.
2. In using a new supplier, check its products, methods and materials thoroughly.
3. Check suppliers periodically, not just at the beginning of a production run.

Usually, the first sample parts a supplier submits are accurate, but as production continues, periodic sampling often shows up some which do not meet specifications. This isn't always controllable by a supplier. Changes in material, tooling wear and lax inspection can lower quality without a manufacturer realizing it.

Manufacturing — Design, sales and marketing all influence quality. Engineers can design for almost any quality level that's wanted. The problem is how to arrive at a level which can be maintained profitably.

One expert says that when a company puts defects amounting to 0.5 per cent in a customer's hands, it's in trouble. That's a good goal, but most quality control men suspect that the figure is closer to 5 per cent.

Problems — Competition often upsets quality levels during production runs. One manufacturer, for example, designed the cheapest transmission possible to meet customer requests. After production started, the sales department pointed out that a competitor was winning the sales race because it offered a smoother shift. Redesigning was expensive, and inspectors had to revise quality levels to approve the new transmission.

F. F. Galbos, quality control director, White Motor Co., Cleveland, suggests that an inspection planning department is needed to determine what essential qualities must be maintained in each part and in each manufacturing operation. This department should include sales, engineering, manufac-

(Material in this department is protected by copyright, and its use in any form without permission is prohibited.)

turing and quality control personnel.

Happy Medium — Inspectors would like to create one set of standards for an average or ideal customer. They admit it's practically impossible. The finish on a car is important to one buyer, but another customer wants to be sure the windows don't stick. The owner of a truck fleet reports that he pays more per mile to maintain windshield wipers than he does to service transmissions.

This is where service departments or dealers play an important part. Often, the dealer has the final responsibility to see that the customer gets the kind of quality he wants. This is particularly true of truck manufacturers; slightly less so for automobiles.

Service — Mr. Kenney reports that GMC's Truck Division set up its own customer service department for buyers who pick up trucks at the plant. GM Truck found that it had to take over dealer service problems. It also discovered that this was a good way to find out what the customer wants.

In controlling quality at the service or dealer level, three points stand out:

1. Service tests must be up to date. An inspector explained that a customer found a loose bolt on one truck two years ago. The service department still checks that bolt on all models today even though it's unnecessary.

2. Emphasize seasonal checks. In summer months, for example, it is important to check for vapor locks.

3. Be sure that the service department or dealer doesn't make checks that can be made at less cost by the factory.

Machinability—Even though a part or manufacturing process may be falling below an acceptable quality level, it's often difficult to correct because management won't buy tools to build the part to proper specifications.

White Motor Co. solves this problem with its ECR (Engineering Change Request) committee. This group is composed of men from all phases of sales, manufacturing, engineering and inspection.

It reviews requests for machine changes to see if quality levels will be improved and if costs can be met.

Standards—Even this brief summary shows that controlling quality is a many-sided problem. Pilot production runs, proving ground tests and customer surveys don't answer all the questions.

Safety, costs and personal experience are yardsticks by which most inspectors judge whether a unit should be accepted or rejected. Quality control departments are happy if they can please most of the people most of the time.

GM To Build in California

General Motors Corp., Detroit, soon will start building an assembly plant in the San Francisco-Oakland bay area.

Harlow H. Curtice, GM president, says he expects the plant will be ready to produce 1958 Buick, Oldsmobile and Pontiac cars. It will cover 1.5 million sq ft and will have a total employment of about 5000. Normal productive capacity is rated at 100,000 cars a year.

The California market account-

ed for 9.3 per cent of GM's new car sales last year, compared with 7.6 per cent in 1954.

Chrysler Tests Turbine Car

Chrysler Corp., Detroit, reports that its engineers are driving a turbine powered automobile from New York to Los Angeles.

The car, a four-door 1956 Plymouth sedan, left New York last Monday (Mar. 26). James C. Zeder, engineering vice president, says: "The results of this road test will provide us with additional insight into the potentialities of the gas turbine as a new source of power."

Mr. Zeder emphasizes that the development of less expensive non-strategic materials for turbine wheels and blades, plus better manufacturing methods, are among the problems to be solved before gas turbine engines can be produced in quantity.

Exhaust Notes

Studebaker-Packard Corp., Detroit, says that gold anodized aluminum grilles have been standard equipment on all of its Packard cars since Mar. 5 . . . GM reports that its Electro-Motive Division uses apricot pits to clean traction motor armature cores. . . Copco Steel & Engineering Co., Detroit, has announced that it will enter the truck-trailer field with an all-aluminum model. Trailers will be made in a Copco plant near Centerline, Mich. If sales go well, the company plans to expand to plants in South Bend, Ind., and Detroit. . . Edward T. Ragsdale, general manager of GM's Buick division says that auto buyers are trending toward lower priced lines. He points out that sales of the low-priced Buick Special are running around 56 to 57 per cent of production, compared with about 53 per cent in 1955. Buick dealers delivered 18,441 cars the first ten days of March. That's 6 per cent more than in the previous period. . . Chrysler Corp. took 18 per cent of the domestic new car market in the last ten days of February. Sales for that month were 14 per cent higher than January, 1956.

NEW DEPARTURE

BALL BEARINGS

NEW INTEGRAL-DRIVE BLOWER MOTOR DEPENDS ON SEALED BALL BEARINGS!

5 advantages of New Departure's Sentry-Seal ball bearings in electric motor applications

- **SEALED AND LUBRICATED FOR LIFE!** No need for relubrication; no danger of over- or under-lubrication.
- **SIMPLIFY DESIGN!** Eliminate need for separate seals and grease fittings.
- **CARRY LOADS IN ANY POSITION!** Moving parts are held in positive alignment, regardless of motor mounting position.
- **WEAR IS NEGLIGIBLE!** Require no attention for adjustment for wear. Have a reputation for outlasting the products they serve.
- **QUIET-RUNNING!** New Departure ball bearings are precision-made, run smoothly. Their uniformity is a guarantee of dependability.

Nowhere is the superiority of New Departure sealed ball bearings in electric motor applications better exemplified than in this new integral-drive blower motor.

Revolutionary "inside-out" design of this new motor imposed a lubrication problem solved by the permanent-lubrication characteristic of the finest sealed ball bearings. In this motor, the rotating element, to which the blower wheel is attached, is on the outside and revolves around a stationary shaft through which the lead wires pass. "Sealed and lubricated-for-life" New Departure ball bearings were selected because they assure permanent lubrication, regardless of centrifugal force. Also, because motor and blower wheel share the same permanently lubricated bearings, this integral unit is free of the need for periodic servicing.

Equally important, New Departure sealed ball bearings handle combination loads in any position . . . assure positive alignment of rotor and stator. This means a versatility of application for this motor that offers new freedom to designers.

Sealed ball bearings also help increase motor efficiency and reduce electrical hum. Since in ball bearings wear is so slight as to be entirely negligible, designers were able to build in a smaller precision air gap, which is maintained throughout motor life.

Let New Departure's unexcelled engineering service show you the many advantages of sealed ball bearings in electric motor and other applications.

When you make hollow parts . . .

**Start with
seamless tubing**

**instead
of bar stock**

Save steel, machining time!

WHEN you make hollow parts from bar stock, you waste time boring the center hole—you waste steel because you have to throw away the chips you bore out. Why not do it the easy, economical way? Start with Timken® seamless tubing. The hole's already there! Finish boring is often the first production step. You cut machining time—get more parts per ton of steel.

With Timken seamless tubing, your machine tools are more productive. Screw machine stations normally used for drilling can be released for other jobs. You get added machine capacity without additional machines.

To make sure you save even *more* steel, our engineers

will study your problem and recommend the most economical tube size for your hollow parts job, guaranteed to clean up to finish dimensions.

You also get the highest internal quality with Timken seamless tubing. The piercing process by which it's made is basically a forging process. Result: a uniform spiral grain flow for greater strength and a refined grain structure which brings out the best quality of the metal. And the Timken Company's rigid control keeps the quality uniform from tube to tube and heat to heat. The Timken Roller Bearing Company, Steel and Tube Division, Canton 6, Ohio. Cable address: "TIMROSCO".

High Plateau of Late '55 To Continue

"THE NATION'S business activity, still in the leveling-off process, will continue for the next few months at the high plateau reached late in 1955," says George Hitchings, Ford Motor Co. economist.

Mr. Hitchings' statement typifies the stand being taken by more and more businessmen as 1956 passes into the second quarter. And there is firm foundation for this prognostication. The Ford spokesman says there are three main reasons for this "sidewise movement." Primary metal industries can't go much higher because they are "bumping against production capacity ceilings." Demand for new cars and housing has undergone a moderate slowdown, and production of cars for inventory build-up has stopped.

The Key—But nonautomotive inventories hold the key to business activity for the second half, Mr. Hitchings believes. They probably will continue to rise during the first half because of good sales volume and uncertainty regarding the upcoming steel industry wage negotiations. Consumer demand, business investment other than inventories and government purchases probably will remain at current levels or higher during the second half, he says, unless employment and income are cut back because of high stocks of goods.

This sidewise movement is evident in the Federal Reserve Board's industrial production index, which held to January's 143 (1947-1949=100) during February. (See chart, page 72.) And the March report of the National Association of Purchasing Agents indicates it will continue that way. On production, 33 per cent of the

respondents (against 32 per cent for February) reported an increase. Thirty-three per cent reported better new order positions, compared with only 30 per cent in February. There was a decrease of 1 per cent in those reporting fewer orders. Employment is increasing, with expected improvement in this area later this spring.

CHOICE

Take yours—

from the complete line of

JOMAC

WORK GLOVES

Whatever your handling operations may be, you can choose with confidence the Jomac Gloves that are right for them. And you can be sure of getting quality—lasting quality, stemming from 18 years of pioneering and leadership in the industrial work glove field.

Jomac Work Gloves are:

- made of cut-resistant, loop-pile Jomac Cloth—the fabric that protects hands from cuts and abrasion like no other
- manufactured in knit wrist, safety cuff or gauntlet styles—in heat-resistant, flame-proof, plastic-coated types
- great for economy—can be used, cleaned or reconditioned, and reused again and again
- adaptable—many styles are interchangeable, with 4 long-wearing surfaces per pair
- rugged—they outwear canvas gloves by a profitable margin!

Jomac manufactures all types of hand-to-shoulder protection. The choice is yours.

FREE JOMAC CATALOG

Write us (on your company letterhead) for your free Jomac Industrial Work Gloves Catalog—and for recommendations on types of gloves to use for your handling operations. We'll gladly supply sample gloves. Address: Jomac Inc., Dept. E, Phila. 38, Pa.

Foundry Equipment Mfrs. Assn.

The survey also shows an uptrend in industrial materials prices.

Special Question — Demand for consumer durables is holding its own, said 54 per cent of the respondents to the NAPA survey, while 37 per cent said it is slipping. Nine per cent see an improvement here. It is significant that many of the members expect an increase in the third and fourth quarters.

That the consumer is in a favorable position to spend is evident: The cost of living in mid-February was unchanged from the month earlier. At the same time, the Bureau of Labor Statistics states that the average weekly take-home pay of factory workers was at a record level for February. Estimated weekly earnings were about \$2.90 higher on a year-to-year basis, and about equal to the January pay envelope. In addition, the Office of Business Economics says that corporations issuing public reports paid out \$809 million in dividends in January, about 12 per cent more than in January, 1955. Bank clearings for 26 leading cities reached the highest point this year—over \$24 billion, says Dun & Bradstreet Inc.—indicating that a good portion of this increased buying power is being used.

First Quarter Sets the Pace

Companies reporting on first quarter business bespeak confidence in 1956 as another tremendous year. New York Air Brake Co. expects first-quarter earnings to be at the level they were in the fourth quarter last year. New bookings are running 19 per cent ahead of those a year ago. Sales of Crane Co. for the first two months of 1956 were 20 per cent ahead of the corresponding 1955 period, and the company anticipates it will operate at capacity for the rest of the year. "Profits will be substantially more for the first six months this year than for the period in 1955," said Frank F. Elliott, president.

U. S. Industries Inc. expects its sales this year to reach \$125 million, compared with a record of \$81.3 million last year.

New Order Position Holds Up

New orders for industrial goods fortify the business optimist. American Supply & Machinery Manufacturers' Association Inc. reports February bookings up 1.7 per cent over the January level to 195.88 (July, 1948=100). This is the second-highest recording since April.

U. S. Bureau of the Census. Data based on reports from commercial and captive forge plants with monthly shipments of 50 tons or more

1951. The Industrial Heating Equipment Association Inc. says orders for industrial furnaces totaled \$12,162,877 during February. This betters any month in 1955, discounting June and December when steel mill furnace orders were included. Foundry equipment orders in January moved to second place within the last 12 months when they registered 195.6 per cent of the 1947-1949 base period (see chart on page 72).

Machine tool builders are sailing along on a backlog equivalent to 8½-months of production at current rates. The February report of the National Machine Tool Builders' Association shows that the industry shipped \$64.6 million worth of tools, second only to December within the last year. Builders are confident that new orders, which slipped to \$86 million in February, will continue to replenish their books.

Incorporations Hit Peak

One blot on the record is business failures. Dun & Bradstreet reports a new weekly postwar record of 300 failures for the week ended Mar. 15. The firm also says February saw 1024 businesses fold, the worst such month since 1941. The

total was slightly below the January report, however. One reason cited by some economists for the heavy toll is the advance in the cost of industrial goods without compensating increases in the cost of the end product to the consumer. For this reason, failures may continue to be a sore spot.

Counterbalancing this trend is the increase in new incorporations. D&B says that 12,503 new charters were issued in February, compared with 11,369 in February, 1955. New business formations for the first two months of 1956 set an all-time high for that period at 25,866.

Trends Fore and Aft

Owen Clarke, member of the Interstate Commerce Commission, says that nationwide production of new freight cars is running at less than half of shop capacity because of steel shortages. Most mill products are in tight supply even though the nation's steel mills are running close to capacity.

Total construction this year may exceed last year by 5 per cent or more, Robinson Newcomb, Robinson Newcomb Associates, told a meeting of the National Industrial Conference Board last month in Atlanta.

JAMES M. PHILLIPS
... Salem-Brosius v. p.-engineering

James M. Phillips was elected vice president-engineering of Salem-Brosius Inc., Pittsburgh. He was chief engineer.

Herbert G. Dillon and George W. Bartlett were elected vice presidents of McKiernan-Terry Corp., Dover, N. J. Both are associated with the Mead-Morrison Division. Mr. Dillon, who joined the company in 1954, is in charge of sales. Mr. Bartlett, with McKiernan-Terry since 1948, is in charge of engineering. A. F. Wilson was named works manager of the Harrison, N. J., plant and Frank W. Hamilton of the Dover plant.

Hanson-Van Winkle-Munning Co. appointed M. A. Tardiff manager, general equipment sales, for its J. C. Miller Division, Grand Rapids, Mich. P. C. Burnham was made conveyor sales engineer for the division.

P. J. Sullivan, vice president of Arrow-Hart & Hegeman Electric Co., Hartford, Conn., was appointed executive vice president.

Norman E. Nelson was elected president of Newton Co., Manchester, Conn.

Chicago Steel Tank Co., Chicago, named George M. Sanders general superintendent. He is in charge of manufacturing for U. S. Industries Inc., subsidiary.

VINCENT L. BRADFORD
... Milford Rivet executive v. p.

Vincent L. Bradford, vice president-sales for Milford Rivet & Machine Co., Milford, Conn., was elected executive vice president.

Hugo W. Biskeborn was appointed chief engineer of Ansonia Wire & Cable Co., Ansonia, Conn. Victor Siegfried was made power cable engineer.

Harley Erickson was made production manager, Eutectic Welding Alloys Corp., Flushing, N. Y.

S. E. Flenner was made product manager, washing machine parts, at Ingersoll Products Division, Borg-Warner Corp., Chicago. He joined Ingersoll last November. He was sales manager of Alloy Precision Castings Co., Cleveland.

Jesse L. Powers was made general manufacturing manager of Buick Motor Division, General Motors Corp., Flint, Mich. Former assistant general manufacturing manager, he succeeds Edward T. Ragsdale, now general manager of Buick. Donald F. Taylor becomes assistant general manufacturing manager and Joseph J. Schweinfurt was made general superintendent of all plants.

John F. Kovanda was made mid-west district administrative manager at Cherry-Burrell Corp., Chicago. Ralph N. Baker was made sales manager for the district.

JOSEPH ROSECKY
... B-L-H v. p.-Eddystone plant

Joseph Rosecky was promoted to vice president in charge of the Eddystone, Pa., plant of Baldwin-Lima-Hamilton Corp. He was manager of manufacturing for the Eddystone operations.

John E. McGrath was promoted by American Steel & Wire Division, U. S. Steel Corp., to assistant sales manager. He transfers from Cleveland to Kansas City, Mo. Formerly manager, market development division, he is succeeded by James K. Sedgwick. John T. Jung replaces Mr. Sedgwick as assistant manager, merchant products sales.

Harold F. Miller was appointed an assistant general manager of the Bethlehem, Pa., plant of Bethlehem Steel Co. He is succeeded as fuel engineer by Thomas J. Law Jr.

Maxwell P. Williams, formerly purchasing agent for Willys Motors Inc., was appointed purchasing agent for the Cincinnati plant of Trailmobile Inc.

Jerome H. Frankle Jr. was named a vice president of Metal Products Co., Niles, O. He will be in charge of the metal stamping division.

Edward S. Reddig, resigned executive vice president of White Motor Co., was elected president of White Sewing Machine Co., Cleveland. He succeeds G. G. Nuss who

was made executive vice president, sewing machine division.

Park Q. Wray Jr. was elected vice president-sales at **National Motor Bearing Co. Inc.**, Redwood City, Calif. He was general sales manager.

B. F. Ostergren Jr. was made sales manager, home heater division, **Siegler Corp.**, with headquarters in Chicago. He was southeast district manager. **R. W. Schmitt** was made assistant sales manager at Chicago.

Lamson Mobilift Corp., Portland, Oreg., promoted **Ivan E. Howard** from district manager of the Cleveland regional office to general service manager.

Donald Culver was named to head the sales division of **Murray Corp.**, Towson, Md.

James H. Bly joined the sales division of **High Voltage Engineering Corp.**, Cambridge, Mass. He was division manager at **X-Ray Inc.**, Detroit.

Norman F. Burdette was named manager of a newly established Dallas branch office of **Baker-Raulang Co.**

R. K. Hendricks, purchasing agent for **Miller Products Co.**, Des Moines, Iowa, was appointed area sales representative for **Interstate Steel Co.**, Evanston, Ill. He will work out of offices in Des Moines.

Jack Bradt was made sales manager, truck division, **Howe Scale Co.**, Rutland, Vt. He was associated with **Safety Car Heating & Lighting Co. Inc.** which, in January, acquired **Howe Scale**. Mr. Bradt was doing market research and development work as part of **Safety** company's expansion program.

T. B. Daniels, Chicago warehouse manager, **Jones & Laughlin Steel Corp.**, was appointed assistant to the warehouse division vice president.

Robert B. Connell was made sales manager, central district, **Titanium Metals Corp. of America**, with offices in Chicago.

C. Foster Harry was named general manager of **Maxim Silencer Co.**, subsidiary of **Emhart Mfg. Co.** at Hartford, Conn.

William B. Shimer was made chief industrial engineer for **De Soto Division** of **Chrysler Corp.**, Detroit.

At the newly created industrial sales division of **National Supply Co.** at Toledo, O., **Carl W. Palmer** was named sales supervisor; **James L. Glidden**, sales engineer; and **Robert R. Sloan Jr.**, sales representative.

Samuel S. Whiteley Jr. was named to the new post of assistant sales manager at **Hunter Spring Co.**, Lansdale, Pa. He rejoins the company after three years with **Faultless Caster Co.**

Farrel-Birmingham Co. Inc., Ansonia, Conn., elected **Austin Kuhns** senior vice president. He has served as vice president and chairman of the company's finance committee since 1946. Mr. Kuhns, at present, directs the company's program of production for the atomic energy industry and the research department.

J. O. Phillips was named sales assistant to the president of **Heppenstall Co.**, Pittsburgh. **Dr. Robert B. Corbett** was named technical assistant to the president.

Arthur C. Treece was made general manager of **General Electric Co.'s** plastic department. Headquarters for the department has been moved from Pittsfield, Mass., to Decatur, Ill.

H. E. Hanley was made sales engineer and assistant to the Chicago district manager of **Transue & Williams Steel Forging Corp.**

Chas. A. Strelinger Co., Detroit, elevated **Charles T. Bush** to chairman, a new post. He continues as chief executive officer, and is succeeded as president by **V. Lee Edwards**. Other officers are **A. Stansell T. Bush** and **John N. Failing**, vice presidents.

Herbert I. Segal was elected president of **Van Norman Industries Inc.**, Springfield, Mass. He is also chairman of **Hasco Machinery Co.**

L. Robert Clinton was made pur-

Large OD Thin Wall Tubing offers New Answers to Design Problems

Superior specializes in an unusually wide range of analyses, shapes and sizes

Today's design engineers are finding large OD thin wall tubing by Superior answers more and more of their design problems. Its light weight makes it ideal for ducting, fuel and oil lines in aircraft. Thin wall tubing also functions efficiently as a low pressure heat exchanger tube. Because of its close tolerances, ductility, and bright, clean OD and ID surfaces, Superior thin wall tubing is an excellent choice for flexible metal hose for the food, chemical and aircraft industries. Other applications include bellows, solenoid cylinder cores, cylinder liners for automobile hydraulic brakes, fractional horsepower motor casings, ceramic drills, electron power tube anodes and cathodes, and casings for radioactive well logging instruments.

A number of analyses in large OD thin wall seamless and

Weldrawn® tubing are available at Superior. Stainless, carbon and alloy steels, beryllium copper, titanium, nickel and nickel alloys are offered in sizes up to 1 1/8" OD with .035" wall maximum; Monel and certain analyses of stainless steel in sizes to 2 1/2" OD with .025" wall maximum.

Superior tubing can be supplied in random, multiple or cut lengths up to 30 feet, and in any of three standard tempers (fully annealed, soft; half-hard drawn; full-hard drawn) or in special tempers required by Government, aircraft and customer specifications. Thin wall tubing can be shipped in special cardboard cylinders, to protect it from dents and scratches.

For additional information, get your free copy of Data Memorandum No. 4. Write to Superior Tube Company, 2005 Germantown Ave., Norristown, Pa.

Jacob Rosen, 74, founder of **Buffalo Sashweight & Foundry Co.**, Buffalo, died Mar. 19.

SALT BATH HEAT TREATING Cuts Production Costs!

TYPICAL!

Rejects due to distortion were cut 85% by hardening this clutch lever in Ajax salt baths. Uniform hardness was easily obtained.

1 Parts don't warp out of shape

Distortion of parts is *always* materially less in salt baths than in any other heat treating method because of "automatic preheat," uniform conduction heating of all surfaces regardless of size, ease of fixturing, and the natural buoyancy of molten salt. Most grinding can be completed *before* parts are hardened.

2 Parts get complete surface protection

No atmosphere problems exist since all air is "sealed out" by the molten salt. Even when transferred from one bath to another, a film of molten salt clings to parts, protects them fully to the instant of quenching. Scale and decarb are avoided.

3 Parts heated uniformly throughout

Internal heating by closely-spaced electrodes creates an automatic, electrodynamic stirring action that keeps heat uniform in *all parts of the bath*. Heat treating results are remarkably consistent.

AMERICAN PRODUCTS
FOR
AMERICA

ON HOSE CLAMPED WITH EATON-RELIANCE HÖZ-FAS-NERS®

For tightly sealed hose connections with uniform, automatic pressure all the way around, it pays to investigate Eaton-Reliance Hoz-Fas-Ners.® Manufactured specifically for fastening rubber, plastic or fabric hoses, Hoz-Fas-Ners® speed up production, resist rust, eliminate the need for maintenance, and are re-usable.

Production men find hose fastening work considerably speeded up because of the one-piece design of Hoz-Fas-Ners® which permits ease of application in hard-to-get-at places.

Constant, non-fatiguing spring tension eliminates the necessity of making manual adjustments or re-tightening, even in temperatures where expansion and contractions are frequent. By switching to Eaton-Reliance Hoz-Fas-Ners® you take a major step in reducing initial product cost.

For complete information and specifications, write for a copy of Engineering Bulletin Number 1. It has full details and is yours without charge or obligation.

Boost for Titanium

Demand for the metal is building fast. Here's one capacity expansion. You can bet on more

NATIONAL LEAD CO. and Allegheny Ludlum Steel Corp. will expand titanium sponge production 76 per cent at their jointly owned Titanium Metals Corp. of America plant at Henderson, Nev.

The new capacity will come in toward the end of the year, boosting sponge output from 3600 to 6000 tons a year. Ingot-melting facilities will be expanded to meet the additional production.

Demand Picture—TCMA's expansion will be independent of contractual guarantees from the government. Operations are fully integrated, from ore through selling of rolled, drawn, extruded and forged mill products.

Operations have been at full capacity for some time, enabling the company to make price reductions of 19 per cent for mill products and 23 per cent for sponge in 1955. Output is booked through the third quarter, and demand is expected to rise even more later in the year.

Titanium ingot produced at Henderson is processed into mill products at Allegheny Ludlum's plants. Auxiliary equipment will be added at these plants to handle the new capacity.

Customers — National Lead's New York headquarters says that nonmilitary demand for titanium is rising fast, and that more new commercial applications are to be expected. For defense use, titanium is finding major applications in the J-57 and J-75 jet engines, in the B-52 bomber, in all advanced jet fighters, ballistic missiles and atomic installations.

Civilian jet aircraft, such as the Douglas DC-8 and the Boeing 707, also will use titanium in many structural sections.

Wheeling Shifts Operations

Wheeling Steel Corp., Wheeling, W. Va., will gradually move the operations of its Wheeling factory to other fabricating plants. Some will go to the Steelcrete factory (Beechbottom, W. Va.); some to

the Ackermann factory (Wheeling); and some to the Martins Ferry, O., factory. "These changes will take from six months to a year to complete," says W. A. Steele, vice president in charge of operations. Products of the Wheeling factory have included containers, stove pipe and furnace pipe, roofing accessories, floor and roof decking, gasoline tanks for automobiles and trucks and other automotive parts.

GE Forms New Laboratory

A materials and processes laboratory with testing facilities valued at more than \$750,000 has been established in Lynn, Mass., by General Electric Co.'s medium steam turbine, generator and gear department. George A. Ross has been named manager of the new facility.

Worthington Broadens Line

Mason-Neilan Regulator Co., Boston, will merge with Worthington Corp., New York, and will be operated as the Mason-Neilan Di-

vision. Worthington makes pumps, compressors, turbines and other types of industrial machinery, while Mason-Neilan makes control valves and regulators.

Carrier Plans Expansion

Carrier Corp., maker of air conditioning, refrigeration and heating equipment, will spend \$12 million this year for new buildings and equipment at its headquarters in Syracuse, N. Y. New administration, personnel and research and development buildings will cost about \$5 million; production facilities, about \$5.5 million; miscellaneous improvements and expansion of facilities, \$1.5 million. Expenditures related to research and development will exceed \$3 million, or 25 per cent of the total. The project is expected to be completed late this year.

Establishes Alloy Division

West Steel Casting Co., Cleveland, will establish a high nickel alloy division (West Alloy) in facilities recently purchased at 1679

Keep Plant Air CLEAR of Welding Fumes

Welding shops equipped with Ruemelin Fume Collectors are assured of a clean, healthful atmosphere. Harmful fumes, heat and smoke are eliminated at their source, before they have a chance to spread throughout the shop. This lessens fatigue . . . improves working conditions . . . paves the way for increased plant production. Ruemelin Fume Collectors are approved by Industrial Commissions and insurance companies. Thousands in service. Available with 9 ft., 15 ft., 17 ft. and 20 ft. reach. Write for Bulletin No. 37-E.

need a finish for
light metal parts?

specify
IRIDITE

Here's the finish that combines corrosion resistance and paint adherence with extreme ease of application. It can be welded or soldered with no difficulty and presents no problem in "patching" scratches, marks or scraped sections. Here's what you can do with Iridite:

ON ZINC AND CADMIUM you can get highly corrosion resistant finishes to meet any military or civilian specifications and ranging in appearance from olive drab through sparkling bright and dyed colors.

ON COPPER . . . Iridite brightens copper, keeps it tarnish-free; also lets you drastically cut the cost of copper-chrome plating by reducing the need for buffing.

ON ALUMINUM Iridite gives you a choice of natural aluminum, a golden yellow or dye colored finishes. No special racks. No high temperatures. No long immersion. Process in bulk.

ON MAGNESIUM Iridite provides a highly protective film in deepening shades of brown. No boiling, elaborate cleaning or long immersions.

AND IRIDITE IS EASY TO APPLY. Goes on at room temperature by dip, brush or spray. No electrolysis. No special equipment. No exhausts. No specially trained operators. Single dip for basic coatings. Double dip for dye colors. The protective Iridite coating is not a superimposed film, cannot flake, chip or peel.

WANT TO KNOW MORE? We'll gladly treat samples or send you complete data. Write direct or call in your Iridite Field Engineer. He's listed under "Plating Supplies" in your classified phone book.

Iridite is approved under government specifications

Rocks Canal of the Mississippi river, a concrete reservoir at its plant and more than 4 miles of underground pipeline. The company will increase its annual ingot capacity (1,080,000 net tons) about 30 per cent by 1958. It consumes 5000 to 6000 gallons of water for every ton of steel it produces and finishes.

Westinghouse To Build Reactor

Westinghouse Electric Corp., Pittsburgh, will build a nuclear materials testing reactor near Waltz Mill, Pa., 9 miles south of Irwin, instead of at Blairsville, Pa., as announced previously. Cost of the test reactor will be \$6.5 million.

Cummins Engine To Expand

Cummins Engine Co. Inc., Columbus, Ind., has set aside \$6 million for capital additions in 1956. This includes construction of a 73,000-sq-ft addition to its manufacturing plant. Diesel production will be increased 17 per cent immediately—this is in addition to the 21-per-cent increase announced in January.

Precision Steel Expanding

Precision Steel Warehouse Inc., Chicago, plans to build a strip steel processing plant at Franklin Park, Ill. Estimated cost of the 81,000-sq-ft building and facilities is more than \$1 million. Operation of the firm's Downers Grove plant will not be affected.

GM Ups Diesel Output

General Motors Corp. will increase manufacturing space at its Electro-Motive Division, LaGrange, Ill., by 42 per cent in the next year.

Reason: Increase in domestic and export diesel railroad engine business and increasing demand for mobile generating units and power plants for deep oil well drilling rigs which the division introduced last year.

Says N. C. Dezendorf, divisional general manager and a vice president of GM: "More than a year ago, Class I railroads stepped up buying to complete dieselization as fast as possible. Then came a big

high scorer

**... and in high speed steels,
it's always REX**

Crucible's REX® high speed steel always scores highest on performance—as it has for more than a half century. That's because it is consistently sound and uniform in structure... with dependable response to heat treatment.

But don't take our word for it. Check REX for yourself—by any test you choose. You'll discover that recent improvements in manufacturing techniques have made it better than ever—why REX is today, as it's always been, *the standard by which all other high speed steels are compared!*

REX is immediately available at all Crucible warehouses, or on prompt mill delivery. For a list of helpful data on REX and other *special steels*, write for a free copy of the "Crucible Publication Catalog." *Crucible Steel Company of America, The Oliver Building, Mellon Square, Pittsburgh 22, Pa.*

**YOU GET BETTER RESULTS
IN HEAT TREATING...**

**WITH THIS
IMPROVED QUENCHING
TEMPERATURE CONTROL**

Photograph. .Permission of Ford Motor Co.

● Use the NIAGARA AERO HEAT EXCHANGER to control the temperature of your quench bath and you remove the heat at its rate of input, always quenching at the exact temperature that will give your product the best physical properties. You get uniform results throughout the day's production, prevent losses, avoid rejections, increase your heat treating capacity.

The Niagara Aero Heat Exchanger transfers the heat to atmospheric air by evaporative cooling. It extends your quenching capacity without using extra water. It pays for itself with water savings.

In the installation illustrated the quench is caustic soda. Water also is accurately cooled and the system is easily kept clean. With an oil quench an extra advantage is to prevent flash fires.

You can cool and hold accurately the temperature of all fluids, air, gases, water, oils, solutions, chemicals for processes and coolants for mechanical and electrical equipment. With the Niagara Aero Heat Exchanger you have closed system cooling, free from dirt and scale.

increase in railroad business, and six major roads that had announced they were completely dieselized in 1954 came back and ordered more locomotives. Locomotive rebuild business is growing each year, and export markets now take the equivalent of almost one complete unit each day."

The expansion will be at Electro-Motive's No. 1 plant in McCook, Ill. Two thousand new jobs, many in the skilled worker classification, will be created. Hiring is to start as fast as the new facilities become ready to operate. Some are scheduled to come in this fall.

New Freight Yards Planned

The New York Central Railroad announced plans for revamping and streamlining its freight yard facilities throughout its system.

Details on three major yards are already in, and the railroad says more will be released soon.

Work at Buffalo, Youngstown and Elkhart, Ind., will cost more than \$25 million, estimates President Alfred E. Perlman. The Buffalo project will be first. Construction on its \$10-million electronically controlled classification yard will get under way in the next few weeks. Mr. Perlman says that the road will save \$4.5 million

"MUSCLE TOUGHNESS" OF U. S. RAINBOW V-BELTS

Many scrap metal dealers use the Dempster-Balester to bale sheet metal into easy-to-handle units. The tremendous power of the machine puts terrific shock loads on V-Belts—U.S. Rainbow® V-Belts. These muscular belts stand up under this treatment because they each have the unique Equa-Tensil Cord Section, a scientifically developed "U.S." construction that brings together in a balanced unit the concentrated strength of multiple pulling cords, distributes the load so evenly among the cords that each carries its full share of the load.

U.S. Rainbow V-Belts have greater gripping power, without slippage, because the straight sidewalls grip the grooves the full height of the belt. Every ounce of excess stretch is worked out mechanically before leaving the factory, yet the belt remains elastic enough to stand heavy shock loads.

U.S. Rainbow V-Belts are obtainable through any of our selected distributors, or any of United States Rubber Company's 27 District Sales Offices, or write us at Rockefeller Center, New York 20, N. Y.

HERE'S YOUR
ESCO GUIDE TO
 COST REDUCTION
 in the use of stainless and alloy steels for the
 manufacturing and process industries

CORROSION • HEAT • IMPACT and ABRASION

... whatever the problem, processing, or manufacturing end products, this 100-page book will suggest new and better solutions which can mean immediate cost reductions, increased efficiency and often a superior process or product.

Over 47 pages of specifications, alloy chemical composition and physical properties and handy reference tables and charts on corrosion, heat and abrasion resistant alloys.

The only book of its kind. Here also is the latest information on static, shell molding and centrifugal casting of alloy and stainless steels for all industry.

a year in operating expenses at Buffalo alone. He predicts that shippers will save 225,000 car-days a year.

American Brass Expands

American Brass Co., New York, will spend more than \$1.5 million to expand facilities at its Buffalo Division. In addition to relocating its large machine shop, the company will put in facilities to boost production of copper alloy seamless tubing. Work is to be completed by early next year.

Coming: More Ferromanganese

E. J. Lavino & Co., Philadelphia, has announced it will double its facilities at Lynchburg, Va., for producing standard high carbon ferromanganese. The program is under way, and will be completed before the end of the year. It will increase Lavino's annual ferromanganese capacity (120,000 tons) by 50,000 tons and will cost some \$4 million.

Canadian Tube Mill Improved

Fresh from completing a \$2-million modernization of its seamless pipe and tube mill at Welland, Ont., Page-Hersey Tubes Ltd., Toronto, Canada, plans to up production of its electricweld mill. Revamping the seamless mill has increased its pipe size range from 4 to 7 in. OD.

New Reclaiming Plant

Replacing the zinc dross refining plant in Wheeling, W. Va., which has been operating continuously since 1921, Wheeling Steel Corp. has announced initial operations at its new metal reclaiming unit at Martins Ferry, O.

The plant will be used to recover pure zinc and zinc oxides from Wheeling Steel's galvanizing operations at Martins Ferry and Benwood, W. Va.

Change-Over for Defense

Franklin-Balmar Corp., Woodbury, Md., which is converting its plant for the production of defense aircraft parts, plans to install two more skin milling machines. The

...they are
**IMPORTANT
TO YOU!**

The products you design today to meet the demands of tomorrow must be carefully engineered right down to the smallest component. The product must be geared to the demands of an "automation minded" world and the competition of the years ahead. Production schedules can't be kept up when machinery is down for maintenance. No component you can build into your products will mean more to its efficient performance than the bearing units carrying the load. The exclusive combination of features found only in SEALMASTER self-aligning, pre-lubricated Bearing Units are important to your product's continuous performance and acceptance.

company also will clear its forge shop and replace it with a spar milling department. The switch is to be completed this June.

Holo-Krome Pushes Research

Development of new techniques and methods for metal forging will be the purpose of a Research & Development Division set up by Holo-Krome Screw Corp., West Hartford, Conn. Electronic engineers, physicists and machine designers have been recruited. They will work under Paul W. Klooz, vice president-manufacturing, in a new building on Holo-Krome's West Hartford plant site.

ASSOCIATIONS

Truck-Trailer Manufacturers Association, Washington, has elected its 1956 traffic committee: Chairman is A. L. Rich, vice president Fruehauf Trailer Co., Detroit. Serving with Mr. Rich are Elmer Streibe of Trailmobile Inc., Cincinnati; Jack D. Watson, Hobbs Mfg. Co., Ft. Worth, Tex.; and L. E. Weckert, Dealers Transit Inc., Chicago.

Wayne Dukette, manager of Joseph T. Ryerson Steel Co., Emeryville, Calif., has been elected president of the Northern California Chapter, American Steel Warehouse Association.

Laredo Scrap Materials, Laredo, Tex., and Permian Iron & Metal Co., Odessa, Tex., are new members of the Institute of Scrap Iron & Steel Inc., Washington.

Steel Founders' Society of America, Cleveland, has appointed James M. Ritter to its Product Development Committee. Mr. Ritter, assistant sales manager of Farrell-Cheek Steel Co., Sandusky, O., will assist in the development of new markets for steel castings.

Howard C. McMillen, manager of Philco Corp.'s Bedford, Ind., plant, is the new president of the American Society of Tool Engi-

STEEL PRODUCERS' EARNINGS AFTER TAXES (MILLIONS OF DOLLARS)

31st ANNUAL
**FINANCIAL
ANALYSIS**
OF THE
STEEL INDUSTRY

Supplement to

STEEL

April 2, 1956

Steel Industry: A Billion-Dollar Earner

THE STEEL INDUSTRY's net profit went over the billion-dollar mark last year for the first time. Based on the performance of producers representing 93.64 per cent of the nation's ingot capacity, the whole industry's net profit hit \$1.1 billion.

This achievement came in one great leap. The most the industry had made before was \$766.9 million in 1950. In 1954, net earnings were only \$637 million.

The 1955 net profit was 43 per cent better than that of 1950 and 10 per cent above the 1954 figure.

Record Production Helps

Contributing to the earnings record in 1955 was the record-setting production of steel. Almost 10 per cent more steel for ingots and castings was poured last year than in the previous record steel-making year, 1953. The new steel production record was made possible by record capacity, and output at 93 per cent of this capacity.

Among other reasons for record earnings are increased prices of steel, record volume of sales and sales of a higher-than-usual percentage of the more profitable products, like cold-rolled steel sheets. They comprised 17.9 per cent of mill shipments of steel, compared with a range of 12 to 15.5 per cent in the preceding four years.

Sales volume of the entire in-

dustry was \$14¼-billion, a rise of 35 per cent over 1954 and 9 per cent over the previous record sales year, 1953.

In 1955, the steel industry was able to keep 7.82 cents out of every sales dollar—the most since 1950's 8 cents. In 1954, it kept 5.99 cents.

The improved earnings picture is reflected in the net income per ton of ingots produced. It jumped to \$9.51 from 1954's \$7.23 for the 32 companies. Even in the previous high earnings years of 1950 and 1953 the figure was lower.

Absence of a federal excess profits tax (it expired at the end of 1953) also contributed to the improvement in steel industry earnings. Still, federal income taxes took almost as big a slice out of the steel sales dollar (7.78 cents) as was left for the producers.

A Billion Dollars in Taxes

The 32 producers in STEEL's 31st Annual Financial Analysis of the Steel Industry set aside \$1,037,250,232 in 1955 for federal income taxes. The tax figure would have been higher but for fast amortization of facilities installed under the government's defense program. Under it, companies are permitted to recover their investments in a short time. While making this recovery, companies pay a reduced amount to the tax collector. As soon as the investments are recovered, tax bills go up.

The federal tax collector got far

more than those whose money is invested in the steel industry. Net profit (which was only slightly more than the federal income tax in 1955) has to be split two ways: To the stockholders and for replacement of plant and equipment. Stockholders in the three largest steel companies (they have 54 per cent of the nation's steelmaking capacity) received (in cash dividends) from 40 to 44.5 per cent of the net profit. Their share was only 3.2 to 3.6 per cent of the sales dollar taken in by their companies.

Employment Costs Rise

In contrast, employees in the 32 companies in STEEL's survey received 34 per cent of the sales dollar in 1955. Both the number of employees and the costs of employment went up. There were 6 per cent more employees than in 1954, and employment costs rose 19.8 per cent. Employment costs were up for three reasons: 1. There were more employees. 2. Work weeks were longer because of the heavy volume of steel business. 3. Wage rates rose in mid-1955.

The 32 companies increased their working capital 19 per cent, but current liabilities mounted faster than current assets. So, the ratio of current assets to current liabilities was lowered from 2.68 to 1 in 1954 to 2.60 to 1 in 1955.

Long-term debt of the 32 producers rose only 2 per cent in 1955.

THIS SPECIAL REPORT is compiled from data from 32 producers representing 93.64 per cent of the steelmaking capacity in the United States

neers. He succeeds Dr. Harry B. Osborn, technical director of Tocco Division, Ohio Crankshaft Co., Cleveland. The society also elected four new vice presidents, a secretary and a treasurer.

NEW ADDRESSES

Metal & Thermit Corp. is moving its executive offices to more modern quarters at 100 Park Ave., New York 17, N. Y.

National Cylinder Gas Co., has moved its purchasing department from downtown to its plant at 4700 W. 19th St., Chicago 50, Ill.

Trundle Engineering Co., Cleveland, has changed its name to Trundle Consultants Inc. It maintains offices in Chicago and New York in addition to the home office.

REPRESENTATIVES

William R. Morrissey has been appointed sales representative for Wolverine Tube Division, Calumet & Hecla Inc., Detroit. He will headquarter in Wolverine's Pittsburgh office.

Yale Materials Handling Division, Yale & Towne Manufacturing Co., Philadelphia, announces appointment of Harold E. Moon manager of its Cincinnati sales and service.

Robert L. Hall Jr. has been appointed wire and cable specialist for General Electric Co.'s mid-states construction materials district. His offices will be in Cincinnati.

S & W Electric Co. has been appointed representative for the Feedrail Corp., New York, manufacturers of industrial trolley busway electrification systems. Territory: Montana, Idaho, Wyoming, Utah, Colorado and New Mexico. S & W's offices are in Denver.

60 tons kiss the runway at 120 miles per hour

...safely, again and again, on
forged landing gear parts

You've seen big planes, weighing 60 tons or more, landing at speeds up to 120 M.P.H. Landing gear assemblies, essential to this remarkable performance, are made with *forgings* as key components.

Have you thought what this means to your product, your process? Forgings can be trusted in such critical applications because they are sound. That same soundness of forged parts can be useful to you in reducing the cost of equipment you make or use. The soundness of forgings can reduce your costs for inspection, for machining, for rejections, for replacement of faulty parts, and other expenses. Ask us to send you the booklets named below, which explain these advantages and tell you how to get a Forging Engineer's help in determining how forgings can affect your ultimate costs.

ACCURATE LOCATING PERFORMANCE

Acclaimed By Customer with . . .

Spacer Table

Where close tolerances must be maintained on repetitive pieces the Bullard Spacer Table is a "natural"

"The machine is simple to operate. We have found the Bullard Spacer Table very useful in our work", says a foreman at San Diego Division of Convair, "It eliminates the necessity of zeroing to a set position. And there is no chance for error, which is important when you make accurate parts for airplanes."

This same accuracy to close tolerances can be applied to your drilling, reaming or tapping operations without the high cost of jigs or fixtures.

Identical machining operations on each of three holes for battery carriage are performed on the Bullard Spacer Table.

Technical Outlook

PUSHBUTTON FINISHING—Automation in barrel finishing takes a big step forward with the development of a fully automatic horizontal machine that fits into straight line production. The self-contained unit being built by Roto-Finish Co., Kalamazoo, Mich., is suited to large volume deburring, scale removal and finishing. Parts are fed by conveyor into the machine, processed, then washed and discharged on conveyor. First use will be in auto industry for deburring steel stampings.

MORE DUCTILE TI—You can reclaim titanium parts that are too brittle by heat treating them. For Ti-140A, heat to 1500° F, cool at 2° F per minute and hold at the stabilizing temperature (1200° F) for a short time. This improves ductility, reduces strength only slightly. Battelle Memorial Institute worked out the method and reports a similar treatment can be used for RC-130B.

SWITCH TO ALUMINUM—A new experimental high-voltage switch (115 kv, 600 amp) uses all-aluminum structural members. The base is of welded sections; top hardware is aluminum castings; the switch blade is annealed aluminum tube with flattened ends. Bearings, crank levers and tie rods all are aluminum and the assembly is fastened with aluminum bolts and nuts. Connectors between the flexible copper conductors and aluminum hinge castings are copper-aluminum bimetals. Benefits of the switch: It's cheaper, lighter and more attractive.

LONG LIVED—Nodular (ductile) iron has up to four times longer service life under elevated temperatures than gray iron castings, says Simonds Saw & Steel Co. The company just completed a two-year study at its Fitchburg, Mass., plant. It credits the greater service life to nodular iron's resistance to oxidation and cracking caused by growth at high tempera-

tures. The company is using nodular iron for pots, furnace doors, frames and furnace forms which were cast of gray iron.

TI-CLAD—Keep your eye on steel with an overcoat of titanium. It's being done on a laboratory scale by a process called Hortonclad. Armour Research Foundation reports that it bends freely whether titanium is in compression or tension.

PRESTRESSED—The Air Force has under study a wing structure of prestressed ceramic materials that is capable of bearing a normal load. Development of efficient ceramic wings for high-temperature service appears possible through prestressing with cables and other devices.

MARKED MEN—Put a white safety helmet on new men during their first 30 days on the job. If they wander into danger areas, they are easy to spot — they won't be mistaken for old hands who know their job. Duquesne Works of U. S. Steel has used the idea for a year and finds it has sharply cut down accidents among new employees.

CLADS AND COLORS—Fluorocarbons, which have a reputation for sticking to nothing, now can be metal clad and coated with printing inks. International Resistance Co. has announced a copper foil-fluorocarbon laminate. Produced without the aid of a resin adhesive, it has possible uses under severe temperature, moisture and electrical conditions. The inks, in 11 colors, and electrically conducting silver were developed by the M. W. Kellogg Co. They can be applied by standard printing and marking methods.

These cross sections were cut from aluminum shapes produced by continuous casting. Diameter of round bar (lower right) is 4½-in.

Continuous Casting of Aluminum

A semiproduction unit that uses an oil lubricated graphite mold has been in operation about a year. It handles all aluminum alloys (with grain size control) in a variety of shapes and sizes

ALUMINUM INGOTS are loaded into a melting furnace at Apex Smelting Co., Cleveland, and 15 ft below a variety of finished shapes (see above) come out continuously.

Advantages of the process, says H. R. Youngkrantz, Apex's chief engineer, are: 1. Speed at which

bars, flats, squares and hexagon shapes can be produced. 2. Surface finish is good; no conditioning is required for further working. 3. All aluminum alloys can be handled. 4. Grain size can be controlled to fit the application of the product.

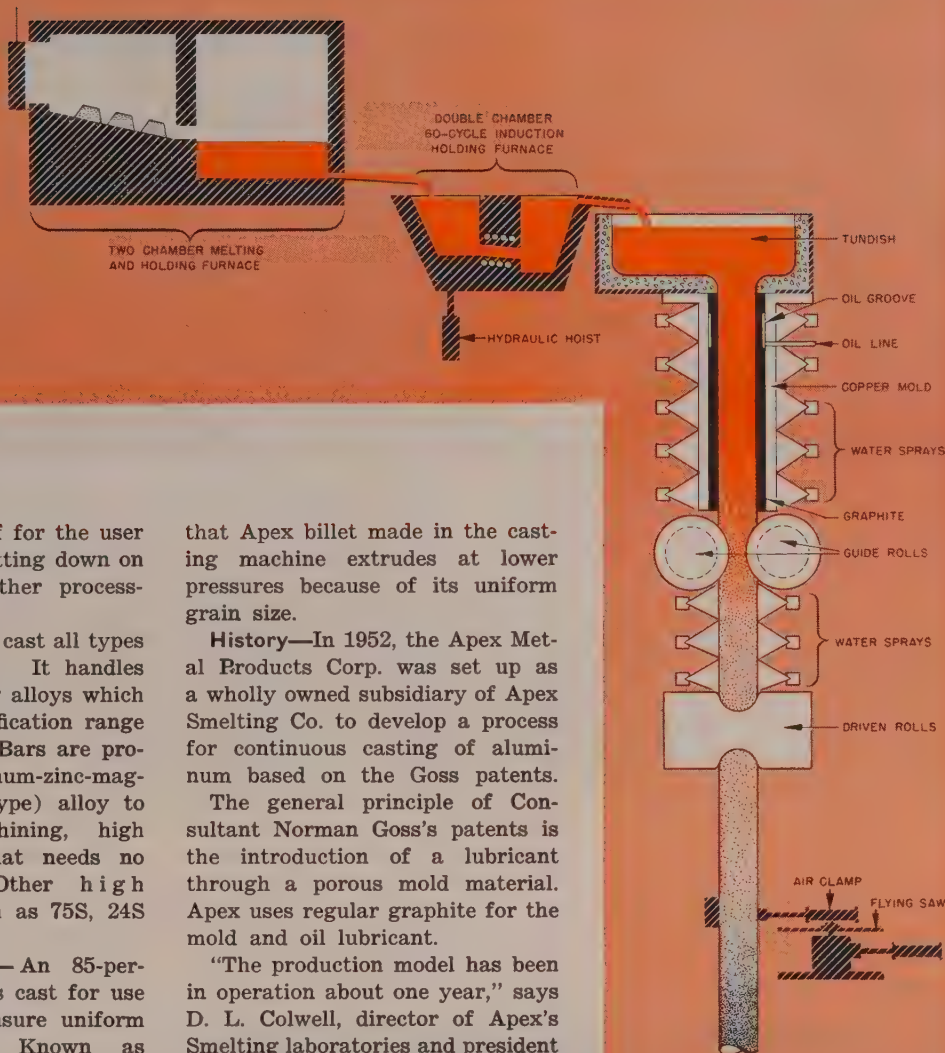

Sizes and Speed — Sizes being

cast are: Rounds, ¾ to 5 in. in diameter. Flats, ¾ to 2 in. thick by 5 in. wide. Squares, ¾ to 5 in. Hexagon shapes, 1 to 4 in. across the face.

Casting speed varies with size of piece. Rod, ¾-in. in diameter, comes out at 16 ft per minute (500 lb an hour). Rod, 5-in. in diameter, is produced at 1½-ft a minute (1 ton an hour). Production of other shapes is in proportion to these rates.

Surface Finish—A novel feature of the Apex process is a patented, oil-lubricated graphite mold. It gives cast shapes a smooth surface

Continuous Casting Process

finish, which pays off for the user of the product by cutting down on conditioning for further processing.

The unit is used to cast all types of aluminum alloys. It handles aluminum-tin bearing alloys which have a 700° F solidification range (1200° to 450° F). Bars are produced with the aluminum-zinc-magnesium (Ternalloy type) alloy to give a free machining, high strength product that needs no heat treatment. Other high strength alloys, such as 75S, 24S and 17S, are cast.

Deoxidation Rod—An 85-percent aluminum bar is cast for use in ingot molds to insure uniform steel deoxidation. Known as Grade 4 deoxidizer, the bar (1, 1½ or 2 in. in diameter, depending on the size of ingot mold) gives better efficiency in making fully killed steel than conventional shot, some steelmakers say.

"This composition has poor casting characteristics and can only be produced in bar form by our method," says Mr. Youngkrantz. Deoxidizing grades 1, 2 and 3 also are cast.

Grain Size—Fig. No. 5 shows examples of grain sizes that can be produced. They can be varied from large to small by regulating speed of casting and the temperature of the hot metal going into the graphite mold.

In bearing alloys, a small grain is essential. For free machining alloys, a uniform, medium grain is preferred. Extruders report

that Apex billet made in the casting machine extrudes at lower pressures because of its uniform grain size.

History—In 1952, the Apex Metal Products Corp. was set up as a wholly owned subsidiary of Apex Smelting Co. to develop a process for continuous casting of aluminum based on the Goss patents.

The general principle of Consultant Norman Goss's patents is the introduction of a lubricant through a porous mold material. Apex uses regular graphite for the mold and oil lubricant.

"The production model has been in operation about one year," says D. L. Colwell, director of Apex's Smelting laboratories and president of Apex Metal Products Corp., Cleveland.

"Our interest stems from the fact that we can make smooth rod of modern strong alloys at a rapid rate. The process is not 'alloy-sensitive'—the best alloy for the intended use can be produced in the form needed. For example, high strength alloys that do not require heat treatment can be cast," he points out.

Outlook—"We have drawings almost completed on a larger, more rigid casting machine capable of casting rods of extrusion billet size (8 in. or larger)," Mr. Colwell told STEEL.

"Also, we expect to cast tubes in this new machine. When made from extrusion alloys, they will be used as cored billets. In bearing alloys, obviously, tubing is a more

Continuously cast aluminum alloy bars ready for shipment

Aluminum ingots are loaded into a sloping hearth furnace (top) which sends molten metal into induction heated holding furnace (center). It supplies the tundish

Lower level of continuous casting machine. Sections are guided into pit, then cut off to required length by flying saw

satisfactory shape than rod," he said.

Apex has its eye on expanding the metallurgical use of continuously cast rod by producing aluminum alloys containing titanium, boron and perhaps zirconium and manganese.

Other Metals—Although work at Apex has been confined to aluminum alloys, with minor changes, the process will handle other non-ferrous alloys. Several brass fabricators are looking at the process with interest.

Operation—The diagram on page

97 shows how the process works. Aluminum ingots are loaded into a sloping hearth melting and holding furnace. Molten metal flows from the holding section of this furnace into another double chamber, 60-cycle, induction-heated holding furnace.

This furnace supplies the tundish with molten metal at the temperature and rate needed, depending on the alloy and size being cast. Rate of metal flow into the tundish is regulated by a hydraulic hoist to tilt the furnace. No heat is applied to the tundish.

The temperature of aluminum going into the tundish varies with the alloy being cast. It ranges from 1160 to 1300° F. From the tundish, metal goes into the graphite mold directly under it. The graphite mold is encased in a copper outside mold on which water is sprayed for cooling.

Lubricant—The upper part of the graphite mold has a series of vertical grooves which are kept filled with oil by an oil line coming through the copper mold wall. The natural porosity of the graphite allows the oil to penetrate to the inner surface of the mold where it lubricates the casting part as it forms and moves through it.

Beginning—To start up for a particular shape and size, a steel duplicate is inserted which extends into the tundish down through the mold to make contact with pull rolls. The initial aluminum shape forms above this steel starter part and is pulled through the machine.

The aluminum shape leaves the mold, passes through guide rolls, then is contacted by pull rolls. Shapes are guided into a pit. An air clamp holds the section while it is cut off to the length desired (usually a 10 ft or 12-ft piece) by a flying saw that operates a little above floor level.

Etched sections show grain size uniformity. Grain size can be controlled by regulating temperature of metal going into the mold and the speed of casting. Small grains are needed for bearing alloys, larger grains for machining alloys

Nylon tubes take standard tube fittings like these. Tubes are unaffected by air, water, solvents, greases and lubricants found on machinery

Nylon Tubes Take Shake

Vibration is a big problem in the life of a flexible coupling. Nylon tubing in this plant has lasted 25 times longer, shows no sign of weakening

Nylon tubing for machinery will be demonstrated by the Polymer Corp. at the annual meeting and exhibit of the American Society of Lubrication Engineers, William Penn hotel, Pittsburgh, Apr. 4-6.

IF you have a problem keeping vibrating parts connected with flexible tubing, you can solve it with tubes made of nylon. That's what the National Can Co., Chicago, did on its big, 400-per-minute, can-making machines.

Uses—The canmaker (called a body maker) has four parts: An arm, slide, lever and carriage that cycle at the 400-per-minute clip. Each part requires lubrication

which is carried from the fixed base to the moving part by flexible tubes. It was too much for the older tubing which ruptured in two weeks. Nylon tubes still are going strong after a year.

National Can Co. also uses nylon tubes to carry plastic spray, compressed air and water to coat the inside of cans. The former tubing required large connectors which interfered with the spray. Nylon tubing connectors are two-thirds smaller, have the same fluid carrying capacity.

Six Hamilton punch presses cycle 250,000 times a day. Nylon tubing is used to carry lubricant from a central system and for compressed air. Again, nylon lasts

50 times longer.

Advantages — Nylon tubing doesn't plug or foul so quickly as other types. It resists flex fatigue and has a high burst strength per weight unit. It doesn't dent or collapse under impacts that crush metal tubes. It can withstand temperatures up to 475° F, but the maker (the Polymer Corp. of Penna., Reading) recommends temperatures under 180°F.

In the 1/4-in. size, the tubing (called Nylaflow) can be bent on a radius of 2 1/2-in. It is easy to cut and install and uses standard tube fittings. Wall thickness of 0.050-in. will withstand 2500 psi.

The Polymer Corp. claims these advantages when used on the vibrating parts of machinery: 1. Increased tubing life under concentrated flexing. 2. Elimination of machine down time for tubing replacement. 3. Reduction of maintenance time. 4. Smaller diameters of tubing can be used. 5. Fitting and connector problems are simplified.

Constant control from sponge through fabrication produces . . .

Titanium Forgings with a Pedigree

THE FIRST integrated facility to produce titanium press forgings and extrusions is going into operation at Harvey Aluminum, Torrance, Calif.

Sponge will be converted into ingot in a consumable-electrode, double-melting furnace that uses a vacuum in both phases.

Aircraft Quality—"Months of experimentation with a pilot facility have convinced us that the best way to maintain process control of aircraft-quality titanium is to produce our own ingot," says Leo M. Harvey, president.

Already an established producer of wrought aluminum mill products for the airframe industry, Harvey is aiming at the same market for its titanium alloy forgings.

Typical aircraft components the company will produce from titanium include forgings and extrusions for compressor rotor blades, engine rings, fasteners, impellers,

structural members, attachments and AN fittings.

Advantages—As an integrated operator, Harvey gains two advantages—quality control and inventory control. Titanium requires rigid control to maintain the metallurgical properties needed for airframe and jet engine components. Proper blending and alloying of the sponge are necessary to get uniform properties and good working characteristics in the ingot.

The same properties are carried through the fabricating operations and determine the quality of the finished product. Through integration, the stock used in every forging operation has a complete, recorded metallurgical history.

No Tie-Ups—In inventory control, the integrated facility speeds up delivery time to the customer, does not tie up "pipeline" metal. Greater economy is gained since all in-process material is recovered

and remelted to its original purity.

To turn out titanium closed-die forgings, hand forgings and hand forged shapes, Harvey will use its big battery of hydraulic and me-

Ultrasonic apparatus is used to check

Distributors Aim at Replacement

Machine tool salesmen will tackle job of selling to replace current equipment. Part of their new job will be to sell top management on the evils of obsolescence

IF YOU want to know how the battle's going, you check with the men on the firing line. It's as true in business as it is in war.

The "firing line" of the machine tool industry got together recently at the spring meeting of the American Machine Tool Distributors' Association in Detroit.

In a nutshell, the battle is being won. Machine tool sales look to continue at or near present high levels through 1956. A few enthusiasts are even willing to go out on a limb for a good '57.

Cushion—With a healthy chunk of business coming from a bustling economy, distributors (and builders) think this is the time to be selling to the replacement market. This is their biggest plum. It's also the toughest to sell.

On this they seem to agree. If they can crack the replacement market by convincing metalworking management to get rid of obsolescence as it comes up, the alleged boom-and-bust cycle of the machine tool industry will be history. Obsolescence is not a some time thing.

Answers—The big question, of course, is how to sell replacement. To sell a new machine for a new job is one thing: To sell a new machine against one already on the job is quite another.

A panel made up of a builder, a distributor and a user gave its views. Despite separate interests, it agreed on fundamentals right down the line. It sometimes may be the salesman's job to sell his customer on these fundamentals.

Fault? — C. A. Woodley, vice president-manufacturing, Caterpillar Tractor Co., Peoria, Ill., speaking for top management, accepted some of the blame for reluctant

replacement. He told the salesmen: "The past is littered with companies that failed because top management didn't buy the idea of the need for replacement."

Mr. Woodley, J. A. Raterman, president, Monarch Machine Tool Co., Sidney, O., and D. M. Pattison, vice president, Motch & Merryweather Machinery Co., Cleveland, agreed on these checkpoints to sound replacement:

1. A formula is good, but is no substitute for good judgment. Caterpillar, regarded as a progressive in replacement, has modified the MAPI formula.

2. Depreciation funds must be set aside to provide for replacement. Mr. Raterman's firm allocates 2½-times the depreciation rate to allow for inflation.

3. It's essential that management knows what it's costing to use present equipment and be informed on alternative methods.

Two responsibilities, says Mr. Woodley, should force management to update equipment. They are: "To keep the product line attractive to the customer," and to see that the "plant is maintained in a modern condition" to produce the product at maximum profit.

Builder to Consult

H. L. Tigges has retired as executive vice president of Baker Bros. Inc., Toledo, O., to enter business as a consultant on machine tools. Mr. Tigges has been president of the National Machine Tool Builders' Association and the American Society of Tool Engineers, and he was director of the Metalworking Equipment Division of NPA in Washington.

Harvey is installing a battery of new presses for forging titanium and aluminum. The largest is an 8000-ton capacity hydraulic unit

mechanical forging presses, largest of which has 8000 tons of capacity.

Complete facilities for all secondary operations, plus facilities for machining forgings, have been set up. The company installed new analytical equipment, ultrasonic apparatus, mechanical property testing devices and metallographic equipment in its metallurgical laboratory.

Internal quality of titanium forgings

Vertical hones are better for short tubes. These 22-in. tubes will be used on hydraulic dump truck hoists

The hone shown will remove 0.045-in. from this 7 in. tube. Most important cost factor: Good quality seamless tube

Roughing to 10 Microinches

Hones do a one-shot job from rough to finish for this firm. Rough turning and semifinish operations aren't always necessary

FROM ROUGH to finish with a hone: That's what Ohio Honing & Hydraulic Co., Cleveland, does to seamless tubing on a production basis. Costs are lower, rejects are negligible and a finish of 10 microinches rms is routine.

Honing changes the diameter of tubing. Abrasive stones, arranged in holders like the spokes of a wheel, are turned against the surface. As the stones turn, they are moved back and forth on the inside of the tube.

The hones at this plant cut 0.045-in. deep and leave the surface exceptionally smooth. In one aircraft application, the surface is better than 3 microinches.

Tubing—Quality is of the greatest importance in rough material. Without it, rough and semifinish boring, turning or grinding would be necessary. In addition, good tubing makes hones last longer, reduces breakage—a high cost factor in any honing operation.

Concentricity, straightness and weldability also contribute to the low costs.

The first step in production is facing the tubing to length. Threading and honing follow. Vertical honing machines are used for tubes up to 60 in. long; all greater lengths are honed on horizontal equipment.

External honing produces this fine finish from mill finished seamless tubing. Surface finishes of 10 microinches are routine

Uses—Finished tubes vary from 1 to 24 in. in diameter and are from 1 to 24 ft long. The smallest ones are used in jet pilot ejection seats; the largest in offshore drilling rigs.

Story—In 1944, Al Blewett, president of Ohio Honing, started a plant that specialized in repairing ice machine tubes. He found that hones did a good job on tubing.

Later, he bought additional equipment, redesigned it to fit his own job, and his firm became one of the first to finish hone rough tubes without intermediate preparation.

MECHANICAL SCARFING:

The Rush Is On

STEEL's editor-in-chief, Irwin H. Such, gave the International Acetylene Association this picture of mechanical scarfing at its convention in Los Angeles last month

MECHANICAL flame scarfing is playing a star role among improvements in steelmaking. It is invading slab conditioning in earnest. It is getting a foothold in stainless steel. Flame scarfing of nonferrous metals may not be so far off as it seems.

An installation for scarfing steel tube rounds in Germany will be watched with intense interest. The conditioning of cold blooms, billets and slabs may be next, using a flux for flying starts.

Rush Is On—This year, an even

dozen machines have been installed or are under construction. Ten are for processing semifinished steel 50 in. and wider.

How much steel will be machine scarfed in 1956 depends on how fast the machines can be installed. Republic Steel Corp. in Cleveland has a new machine for its 44-in. blooming mill, but because of heavy demand for steel, it can't shut down long enough to install it. This scarfer will have to wait for completion of a new slabbing mill (which also will be

equipped with a scarfer) that will serve Republic's 98-in. hot-strip mill.

In the Act—New machines already in and running include one for handling slabs up to 64 in. wide at U. S. Steel's Edgar Thomson Works (it began operating in January). Weirton's new machine for slabs up to 50 in. wide went in this month.

A machine for U. S. Steel's 44-in. blooming mill at Gary is scheduled for late 1956. Wheeling Steel has purchased a scarfer to tie in with its 66-in. hot strip mill to permit direct rolling. It will be shipped in the fall of 1956.

Other companies with machines on order include Jones & Laughlin, with two coming for slabs and one for blooms and billets. Northeastern Steel Corp. in Bridgeport Conn., has a new machine in and running. Another will be shipped to Sharon Steel Corp. in May. Two machines are being considered by western mills.

A Record—Tonnage hot machine scarfed this year could run as high as 23.5 million tons if all goes well. Based on production of 120 million tons of ingots in 1956, nearly 20 per cent will be machine scarfed, a new record.

As ingot capacity expands, a larger portion will be handled on machines. At least eight American companies have signed contracts or are figuring out what equipment is needed. One company with a machine for scarfing the bottoms of slabs is deciding whether to replace it with one for tops and bottoms or for all four sides.

At Detroit—Among the eight is Detroit Steel Corp. It plans to install a scarfer as part of a continuous strip mill revamping job at its Portsmouth, O., works. Ingots are broken down into slabs on a 44-in. blooming-slabbng mill. After shearing, slabs are stacked in a scarfing yard where they cool down and are hand scarfed. Then the slabs are reduced further on a reversing mill and finished on a 4-stand continuous mill with a single coiler.

With the new layout permitting direct rolling without reheating, the slabs will be broken down on the 44-in. mill, machine scarfed

That spring cleaning urge

The benefits steelmakers obtain from our refractories are in part a result of Basic's on-the-job servicing. One of the rewards of this close relationship has been the opportunity to observe and appreciate the lighter side of these usually serious craftsmen.

BASIC REFRACTORIES, INCORPORATED

845 HANNA BUILDING • CLEVELAND 15, OHIO

Four-side slab scarfing at Edgar Thomson Works (left) and Homestead Works (right) of U. S. Steel

sheared, transferred through a slab-heating furnace for a fast reheat, reduced on the reversing mill (but not so much as before) and finished on the continuous mill which will get two more stands. A second coiler will be added to provide for expanded capacity.

Detroit Steel is an example of the movement in the steel industry to make processing more automatic, improve quality, increase capacity and lower costs.

Box Score—Even though all mills cannot go to direct rolling, mechanical scarfing still is advantageous. One company with its strip mill a mile or so away from its slabbing mill is adding a scarfer. Conditioned slabs will be loaded on railroad cars for shipment to the strip mill.

Including this year, 55 mechanical scarfers were operating or being installed in the U. S. However, older machines have been replaced by Armco at Ashland, Ky., and by Inland at Indiana Harbor, Ind. A third machine at the Duquesne Works of U. S. Steel became inoperative because of layout conditions. So the score for the U. S. as of Jan. 1, 1956, was 52. Counting the eight definitely planned, there will be 60 mechanical scarfers in the U. S. in the next couple of years, not including those reported in the "thinking" stage.

Abroad — In addition, Canadian

mills have two machines in place and a third is pending. Three are in operation or on order in Germany where the steel industry is making a terrific comeback from wartime destruction and dismantling. One machine, the first anywhere for scarfing tube rounds, is for Mannesmann-Huttenwerke.

Another machine for scarfing rounds is in the Johnstown plant of Bethlehem Steel Co. The end product, however, is not seamless pipe. Bethlehem finds it economical to roll squares, convert to rounds (8 $\frac{3}{8}$ -in. nominal diameter) for scarfing and then convert back to squares for subsequent production of wire products.

The nine scarfing machines in steel plants in the British Isles are for blooms and billets, except one in Wales. It's for scarfing slabs for the Steel Co. of Wales's continuous hot strip mill. Japan has been operating a slab scarfer for about two years. Counting machines both here and abroad, in and pending, there are 76.

Growth—Wheeling Steel thinks as much as 85 to 90 per cent of the steel off its 45-in. slabbing mill will go through its new scarfer. Armco at Middletown, O., scarfs about 75 per cent and at Ashland about 20 per cent, depending on orders from customers. U. S. Steel machine scarfs 40 to 50 per cent of the steel rolled on mills equipped with scarfers.

If U. S. ingot capacity is 14 million tons on Jan. 1, 1959, and if 25 per cent is machine scarfed the figure could be roughly estimated at 35.5 million tons. It is possible that 50 per cent more steel will be machine scarfed annually three years from now.

Versatile—The growth in mechanical scarfing is being accompanied by improvements in the equipment. It is being designed more ruggedly and simply with a eye toward: Lower maintenance costs (now estimated at 4 cents per ton for billet machines and 15 to 18 cents for slabbing machines), greater versatility to handle wider range of sizes and increased efficiency.

Most installations are single machines located downstream from the billet, blooming or slabbing mill and ahead of the shear. Usually, they can be rolled out of the line on their own tracks. Bethlehem has a double scarfing setup at its Lackawanna, N. Y., plant. The first scarfer, a 4-sider, is between its 40-in. blooming mill and its 30-in. mill. The second is between the 40-in. mill and the 24-in. mill.

Earlier machines in the steel industry were fitted with heads for scarfing edges, tops or bottoms. The trend is toward scarfing all four sides. Units for combination blooming, billet and slabbing mills are adjustable for sections ranging

FALK
ALL-STEEL

Shaft Mounted Drives — simple-compact-rugged-efficient

Created specifically for the vast number of applications demanding a sturdy and compact speed-reducing unit for direct mounting on the driven shaft, the new Falk all-steel Shaft Mounted Drive is built to give long service life at substantial savings of space, time, power and maintenance costs!

This efficient helical-gear drive, latest in the unmatched list of Falk precision-gearing achievements is an ingenious modification of the time-tested Falk Motoreducer design which has held, for more than 20 years, recognized leadership in this branch of highest-quality power transmission . . . It complements and completes the world-famous Falk line of reduction units covering the entire range of industrial applications.

Investigate the Falk all-steel Shaft Mounted Drive. Write to Department 247 for engineering bulletin, including selection and dimension details.

FALK
... a good name in industry

Carbon steel billet and stainless steel slab scarfed on Linde Air Products Co. machines

ing from 6 to 53 in. wide and $2\frac{1}{2}$ to 14 in. thick.

Gas Flow—Recently developed continuous-slot nozzles produce a ribbon of flame resulting in a smooth, flat surface. Ridges produced by older units with individual nozzles are eliminated. Maintenance costs of the new type versus the older one have been reduced 50 per cent. Down time has been slashed 90 per cent. Older type nozzles can be replaced with this new Linde development.

To take care of camber in the material being scarfed, horizontal movement of the nozzles is controlled by air cylinders and vertical movement by a combination of cylinders and counterweights.

Improvements also have been made in auxiliary equipment providing for slag disposal and smoke removal. Distribution systems for oxygen and acetylene have larger capacity needed to handle the volume of gases used by larger machines. Multiplicity of gas tubing is eliminated in later models.

Scarfig Depth—By regulating flow of oxygen and table speed, it is possible to take off a uniform layer of steel from $1/32$ to $1/8$ -in. Most of the surface defects, such as scabs, slight seams, checks and roll marks, can be removed. Some companies scarf as deep as $2\frac{1}{2}$ -per cent of cross section. Others figure on about $1\frac{1}{2}$ -per cent.

Mills have found through expe-

rience how much metal can be removed economically. Where direct rolling is not practiced, they go just deep enough to remove major defects and then complete the conditioning job by hand scarfig. Where the practice is direct rolling, it's a matter of removing enough metal to keep rejects to a minimum.

As one steelmaker puts it: "It's easier to take the skin off a billet or slab and sacrifice some metal than to take the manpower, plus the time and delay, to gouge out the defects by hand."

Savings vary from a few cents a ton where it is necessary to remove only a small amount of metal to perhaps \$7 a ton where the material must be completely skin scarfig. A conservative average: \$1.50 a ton.

Save—While savings are inherently a part of mechanical scarfig, the question of whether to adopt it depends also on what the steel consumer demands.

One steelmaker expressed the problem this way: "We roll strip in big coils (ten tons or more) at such high speeds no one can see it. Suppose we find a defect as big as a dime? We can't cut it out and the consumer wouldn't take the steel anyway . . . It was clear to us five years ago that we would have to go to mechanical scarfig."

Automobile fenders, cartridge

cases and other deep-drawn parts require steel that will take severe forming without rupturing and with a minimum of rejects, but the quality problem applies to products other than deep-drawing steel. Included are tin plate, high-quality plate, forging stock and specialties such as tool, drill, spring and transformer steel. Some mills are scarfig all cold-heading stock because their customers want to cut down on rejected parts.

Variety—One of the newcomers is the free-machining leaded steel developed by the Inland Steel Co. Another is stainless steel. U. S. Steel at its Homestead Works has been machine flame scarfig cold stainless slabs for some years with units fitted with flux attachments. The flux is iron powder which provides higher temperatures. Atlas Steel in Canada also is powder scarfig stainless mechanically.

Last month, U. S. Steel began its first runs of stainless at Homestead through the mechanical hot scarfiger that went in last November. Trial runs indicate that at proper temperatures, a good job can be done on conventional stainless steels using iron powder flux. Satisfactory results are reported on straight chromium stainless steels without using the flux.

SPECIALISTS IN HIGH-PRESSURE VALVES

When you need a *special* valve—for hydraulic presses and systems or allied hydraulic equipment—call on R. D. Wood. Besides making a complete line of standard valves, we design, engineer and manufacture highly complex valves of many types for many purposes. The three shown here are representative valves used for a hydraulic system, 4500-pound working pressure, for a 35,000-ton forging and forming press. In these, as in all R. D. Wood products, long life and efficient operation are guaranteed by precise design, quality materials and craftsmanship of the highest order. Send for complete details on R. D. Wood high-pressure hydraulic valves.

5" Multiple Spindle Combination Air Valve, 4500-pound working pressure. Height, 5 feet; Width, 3½ feet.

Pilot operated 12" Balanced Stop Valve, 4500-pound working pressure. Height, 13 feet; Width, 6½ feet.

Pilot operated 12" Safety Shut-Off Valve, 4500-pound working pressure. Height, 9 feet; Width, 6½ feet.

TEMPERATURE CONTROL OF HEAT TREATING FURNACES

PART IV

By R. M. SILLS
General Electric Co.
Schenectady, N. Y.

Control Elements

Example of an induction voltage regulator

THE HEAT input to a furnace is regulated by three devices linked together to form a control system: The temperature sensing device (thermocouple); the controller (recorder); and the control element (valve).

Preceding articles in this series discussed temperature control in general, controllers and sensing devices like thermocouples. (STEEL Feb. 13, p. 108; Feb. 20, p. 135; Mar. 26, p. 130). Upon the control element falls all the work of varying the flow of power, gas, oil or electricity. It may be sensitive, but it must be strong enough to handle tremendous energy.

For electric furnaces, control devices may be divided into two categories: Those that turn power on or off and those that vary it.

Contactors, Relays — Magnetic contactors are more common on electric furnaces. Similar to relays, they differ in size. Arc chutes and blow-out coils extinguish the arc when a heavy current is interrupted.

When a contactor is used in the primary of a transformer, the magnetizing input current frequently exceeds the maximum safe make-

current for the contactor, especially if the transformer rating is close to the contactor rating. For this reason, contactors are derated as much as 50 per cent when used in the primary of transformers.

Use 115-volt power for controlling contactors. If the supply voltage is 230 or 460, get a control transformer. An adequate kilovolt-ampere rating can be obtained by adding the inrush current of the largest contactor to the holding current of all other contactors. Multiply this total by the control voltage and divide by 3000. Add to this result the power requirements for temperature control instruments and other devices.

Relays—Most of the larger contactors have inrush or holding currents that exceed the rating of the instrument contacts. To overcome this, a relay is used to control the contactor. If the differential between opening and closing temperatures is small and control contacts are not snap acting, the relay and the contactor are likely to chatter. Small differentials may give close temperature control but are a source of high maintenance and tend to promote welding of

the contactor tips.

To avoid this, a three-wire connection is used. With these circuits, separate contacts close and open the relay. These are arranged so that momentary operation of each contact will cause the relay to operate. If the control contact momentarily operates (as might be the case when some vibration is present), a definite temperature change is required to operate the relay in the opposite direction.

Contactors are measured in number of operations at frequencies up to 20 times per minute. The mechanical life varies from 10 million operations for the small, vertical lift contactors to 1 million for the larger, clapper type.

Wear—Contactors vary with coil voltage. For example, if the coil voltage is 10 per cent above normal, the coil pull will be 21 per cent higher and the hammer blow about 46 per cent greater.

Tip life is less than the mechanical life and is in the range of 250,000 to 1 million operations at rated load. Load and inrush current also affect the tip.

Maintenance — Inspect furnace

Saturable-core reactor

Totally enclosed, water-cooled ignitron contactor

control contactors on a regular schedule. Clean off any dirt, oil or grease on the contactor and replace worn-out contacts. A slight hum is normal for devices using an alternating-current magnet.

Contacts should not be lubricated—it will shorten their life. Copper and silver contacts become darkened and rough in normal operation, but this does not interfere with their operation or indicate that the contacts should be filed. In fact, normal pitting increases the contact surface, and filing off the bumps may decrease surface below normal. In general, contacts do not need attention during normal life, but if prominent beads form on the surface because of severe arcing, the contact faces may be dressed with a fine file. Do not use sandpaper or emery cloth.

When replacing, adjust contacts for proper wipe and contact force. Wipe occurs from a combined rotary and sliding movement of the tip. During the wiping process, the contact springs compress, providing positive pressure regardless of normal wear.

The most serious trouble that may occur is sticking or welding

of the tips. This is one of the most frequent causes of overheated electric furnaces. Proper maintenance reduces sticking; overtemperature protection prevents overheating.

Welding of contact tips is similar to flash welding. Anything that causes the tips to hesitate or operate in rapid succession can cause welding. Trouble may be traced to weak springs, a magnet that bounces, too narrow a differential setting, vibration, insufficient relay interrupting ability which allows the contactor to hesitate, misaligned contact tips or insufficient tip wipe, poor control-power regulation and demand limiting or priority control which may choose the moment the contactors are closing to open the circuit.

If the tips are welded solidly, the trouble will be apparent. However, the tips can weld lightly and later break loose. When this occurs, the evidence is on the tips in the form of small beads.

Mechanical sticking comes from binding of the shaft or bearings, warping of the base or an accumulation of dirt or grease. In vertical lift devices, gums or dirt may pre-

vent free movement. The armature or magnet may bind due to misalignment or from residual magnetism.

Ignitron Contactors — Ignitron tubes are electronic devices used principally for resistance welding service. They consist of a cylindrical, water-jacketed steel shell, with a graphite anode and a pool of mercury for the cathode.

When a current flows through the ignitor (a small electrode touching the mercury pool), enough mercury is vaporized to start the main arc.

A single ignitron is a rectifier. For controlling alternating current, two tubes are connected back to back (push-pull), with each conducting on alternate half cycles. Two tubes connected in this way are called an ignitron contactor.

Ignitron contactors are used as a substitute for magnetic contactors and are especially suitable when frequent operation is required. They are not subject to sticking or welding, are quiet in operation and free from vibration. They require little or no maintenance. Their disadvantages are cost (particularly for 3-phase

Typical solenoid valve

loads) and continuous water cooling. Ignitron contactors are not satisfactory below 100 amperes and 230 volts.

For certain electric furnaces, on-off control is not sufficient and a variable power control is necessary. Ignitrons may be used with a heat control panel or other phase shifting device to accomplish this. Instead of using the ignitrons as a switch, the heat control allows the firing to be delayed until later in the cycle, so that only a portion of each half cycle appears across the load.

Induction Regulators — These have long been used in electric power distribution systems as feeder voltage regulators. Induction regulators are adaptable to electric furnace use. Essentially a form of autotransformer, these units have an extended winding on a rotor. Voltage can either be added to or subtracted from the supply voltage. The kilovolt-ampere rating, hence the cost, increases with the percentage of voltage change. Wide voltage variations are expensive, so they are most often used when small voltage changes (10 or 20 per cent) are adequate.

Induction regulators have been used with tapped transformers as a vernier adjustment between taps.

Saturable Reactors—The saturable reactor is the most common and versatile adjustable voltage control for furnace use. It acts

as a valve to regulate the amount of current flowing to the furnace.

The reactor consists of a laminated iron core with three windings—two alternating current and one direct current. The two alternating-current windings are connected across the main power supply in series with the furnace. The direct-current winding is connected to a control panel. With no current in the direct-current winding the impedance of the alternating-current winding is high, and most of the power supply voltage appears across the reactor giving minimum power input to the furnace. The reverse is true when maximum current flows in the direct-current winding. Intermediate values of power input are obtained by varying the current in the direct-current winding. About 4 watts of control power are required for each kilowatt of load power.

Reactors have other practical advantages. Reactors are rugged and are essentially transformers with no moving parts requiring maintenance. Efficiency is high, (98 per cent plus). Easily controlled, even in sizes up to several hundred kilovolt-amperes, they provide a ready method for limiting or regulating load current.

The disadvantage of reactors is cost.

Valves — For gas or oil-fired furnaces, the problem is controlling flow. It can be controlled by varying either the pressure head or the resistance. In virtually all furnaces, the resistance method is used, and the device which accomplishes this is the valve.

Valves most commonly used on fuel-fired furnaces are one of three general types: Butterfly, sliding stem and rotary plug.

The butterfly valve is like the pipe damper used in coal stoves and the choke valve on automobile carburetors. It is inexpensive and has the advantage of low pressure drop in the wide open position. It is admirably suited for two or three position control, although lack of positive shutoff may require an additional valve.

Sliding stem valves are made in a wide variety. The single seated sliding stem valve is similar to a globe valve, providing positive

shutoff when required. Where positive shutoff is not required, the double seated valve is more often used, and has somewhat better characteristics for modulating control. Either type may be obtained with various plug designs, such as V-port and parabolic.

The rotary plug valve consists of a ported sleeve or plug which is rotated in the valve body. As with sliding stem valves, the port may be shaped to produce straight line, parabolic, logarithmic or other flow characteristics. Its most useful form contains a curtain which can be moved axially to provide an adjustable port.

Valve Selection—The success of any valve depends a great deal on proper sizing.

For two or three-position control, valve characteristics are unimportant and selection is easy. The chief requirements are size to handle the maximum flow and a tight enough shutoff to provide minimum flow.

When it provides this, the butterfly valve is well suited because of its low pressure drop and low cost. When positive shutoff is required, a solenoid-operated sliding stem valve is used in series with it. Such a valve also may be used, either alone or in combination with a butterfly valve, to provide a slow increase for smooth lighting.

Modulation — The proper selection of a valve for modulating control is more involved. Extreme conditions must be considered, as well as the flow rate at all intermediate positions. This is called the valve characteristic.

Published data show area characteristics, or flow with constant pressure drop, as when discharging to atmosphere. In use, the valve does not discharge to atmosphere, and its characteristics are different from those published. The downstream resistance increases with flow, reducing the pressure drop across the valve. This is not easy to calculate, so it is necessary to rely on empirical or experimental rules.

The effect of varying pressure drop is minimized by increasing the maximum pressure drop through the valve. This increases the cost and the blower pressure required. A good compromise is

Arches . . . cut installation time with "tailor-made" arches of Armstrong Insulating Fire Brick

Every brick in an Armstrong "tailor-made" arch is machined to the proper taper for perfect keying action and non-slip fit. They lay up faster, fit exactly, and have a structural stability that cannot be obtained when standard arch or wedge brick are used. The small end of each brick is marked with a colored dot to save laying time and avoid errors. When ordering, just state the span, rise, thickness, and length of arch.

Write for free booklet giving full details on the entire line of Armstrong Insulating Refractories. Address Armstrong Cork Company, 2704 Reed Ave., Lancaster, Pa. Next time you have a furnace building or lining problem, Armstrong engineers will be glad to help you find a practical answer.

Armstrong INSULATING REFRACTORIES

to provide for a drop in the piping of one-sixth of the blower pressure, plus (for modulating valves) a drop of one-sixth of the blower pressure across the valve.

Valve Operators—Control valves may be operated pneumatically, hydraulically or electrically. Probably the simplest is a solenoid, frequently used with small sliding stem valves for on-off control and for automatic shutoff valves. Solenoids are used as pilots to control large, air-operated valves.

Sliding stem valves are used with diaphragm air operators. This type is found in chemical and petroleum plants. For such applications, not only is the sliding stem valve desirable, but pneumatic operation is preferred because of low cost, speed and freedom from explosion hazard.

For furnace work, particularly with butterfly and rotary plug valves, the electric motor operator is popular, particularly where little or no compressed air is used for control.

Special Valves—The ratio valve and the safety shutoff valve are important in gas furnace control.

The ratio valve maintains a constant gas to air ratio. The pressure in the downstream side of the valve always will equal the pressure below the diaphragm. The diaphragm side may be connected to the air line, down stream from the control valve, or, if zero gage pressure is required, opened to the atmosphere. The valve then functions as a zero governor.

The safety shutoff valve is a safety requirement on any gas furnace. It is a sliding-stem, globe valve which is both solenoid and manually opened. If power fails, the automatic shutoff prevents gas flow. The safety shutoff also is wired in series with pressure switches in the air and gas lines, so that a drop in either will shut off the gas.

The last two articles in this series (Apr. 30, May 7) will deal with standard and special control systems.

• Extra copies of this article, one in a series of six on temperature controls, are available in quantities of one to three until supply is exhausted. Write Editorial Service, STEEL, Penton Bldg., Cleveland 13, O.

Choosing the Right Valve

What is the best characteristic curve for a valve? In most cases, a curve like the upper line above is undesirable. It produces either too much change in flow near the closed position or too little near the open position. If the control works under high input conditions it may seesaw or hunt during low input.

In a furnace, the flue gas temperature increases with flow, causing a drop in efficiency. It is desirable to increase the flow more rapidly as the valve opens, similar to the two lower curves shown. This requires a more expensive valve with a high valve pressure drop. An accurate knowledge of the pressure drops in the system is needed to select the correct valve size. For the majority of furnace installations an approximately linear characteristic is satisfactory.

If the pressure drop in the pipe is known or can be calculated, a butterfly valve may be chosen that has reasonably linear characteristics. However, sufficient information on the piping frequently is not known. In these cases, the adjustable port valve is useful, as it can be field adjusted to provide the proper pressure drop with approximately linear characteristics.

Traveling Mill

Work fixtures on this boring mill are permanently mounted; spindles travel to them

A FLOOR-TYPE horizontal boring mill, with two traveling spindle columns and four work stations, saves 50 to 60 hours of setup time a month in machining turret lathe bed castings at Warney & Swasey Co., Cleveland.

The installation, built by Lucas Machine Division of New Britain Machine Co., Cleveland, lets the operator take the spindle to the work, rather than the work to the spindle.

Permanent Fixtures — Fixtures for each of the four saddle-type turret lathe beds being machined are permanently mounted on floor-level, cast iron tables. The mill's twin columns move at right angles to the table on two 40-ft rails.

To move the columns longitudinally, the operator clutches a revolving nut onto a stationary screw mounted between the rails. Two pushbutton pendants control all motions of the columns. A third column can be added to the machine if production schedules require.

LATHE BED CASTINGS

... permanently mounted in work fixtures

Boring Bits — Sectional tool boards are mounted on racks beside each fixture. Each section contains the necessary rough and finish carbide boring bits to complete the various diameters and faces which comprise one bore.

Boring bits are of the quick-lock, microadjustable type, pre-ground and set. Beneath each bit is a tag indicating its tool number and operation number. Blue tags are used for finish cutters to further aid quick identification.

*Big machine volume and speed
in this compact new*

PRINTMASTER 810

Sturdy, compact, smartly styled, the new medium-priced Printmaster 810 has *everything*—easy, low-cost operation, high speed and *big machine* production capacity.

It prints and develops in one continuous operation at speeds up to 40 feet per minute... easily handles roll or cut stock as wide as 42 inches. Easy-to-reach controls command quick response throughout the machine's entire operation. Developing and printing sections are automatically synchronized for simplest operation at any speed.

Complete diffusion of vapors through exclusive "jet-nozzle feed" insures uniform, dry, fully developed prints. Spacious receiving trays automatically stack prints in sequence. Electrically welded one-piece assembly stands 61" high, 61" wide, 42" deep (including feedboard).

See and try the Printmaster 810 yourself. Call your nearest Ozalid distributor for a demonstration. His number's in the phone book, or write Ozalid, Dept. P-4, Johnson City, N. Y., for descriptive brochure.

LAUNDRY FOR AIR...

**Stainless from the
HOUSE OF STAINLESS**
Thrives on Diet of Dust and
Water in this Wet-Type
Dust Collector

THE NEED—In developing the Roto-Clone Exhauster and Dust Separator, American Air Filter needed a material for the impeller blade assembly that would withstand the constant wear of abrasive dust and the corrosive action of the continuous water spray. Moreover, the material had to be workable for the intricate fabrication required.

THE ANSWER—Here was another job for stainless steel. But *which* stainless would give them all the properties they needed? For the answer, American Air Filter drew on CSS know-how. The stainless recommended has met every requirement for protection against wear and corrosion, and in addition, has provided the extra strength for vital parts to assure long service life.

Photos, courtesy
American Air Filter
Company, Inc.,
Louisville, Kentucky

Perhaps you are already using stainless steel in your product. Or, you may be considering its advantages for your production.

In either case, it is most important to make sure that the stainless you use is the *right* stainless for your purpose.

The House of Stainless will gladly help you select the proper grade and type. This service is backed up by comprehensive warehouse stocks and direct mill shipments through our mill placement department.

Ram Truck Attachment Rotates 60,000-Lb Steel Coils

Flexibility is added to coil storage methods by this attachment for automatic HR series electric trucks.

It picks up steel coils in either a vertical or horizontal position and rotates them to the opposite position without distorting the sheet or damaging the coil ends.

It eliminates the need for a separate coil up-ending unit in rolling mills and increases the usefulness of the heavy ram truck.

The attachment consists of a 90-degree rotator offset about 45 degrees vertically. A clamp and ram unit holds the coil securely during rotation to prevent it from telescoping. *Write:* Automatic Transportation Co., 149 W. 87th St., Chicago 20, Ill. *Phone:* Radcliffe 7-7000

Dividing Heads Are Built for Gear Cutting, Cam Milling

The 10, 12 and 14-in. dividing heads are accurately built for high precision work.

The dividing head spindle is mounted on antifriction bearings carried in a block having 360-degree peripheral clamping. The block is mounted in a housing to give 145-degree angular positioning of the spindle in the vertical plane.

A crank with a retractable pin handle, a sector for spacing and a reversible index plate comprise the indexing arrangement.

The crank's rotation is translated through a worm to a worm wheel keyed to the spindle.

For direct indexing, a bracket on top of the dividing head engages holes in the spindle nose. *Write:* Cincinnati Milling Machine Co., Cincinnati 9, O. *Phone:* Redwood 2121

Compact Arc Welder Uses Selenium Rectifiers

The direct-current Bumblebee has a single range of adjustment. Its low design permits stacking for parallel operations.

The machine is waterproofed for outdoor operation. A patented transformer produces instantaneous voltage recovery and control to give an easily handled arc.

Low operating temperatures are assured by forced draft ventilation. The fan is powered by a heavy duty, permanently lubricated, ball bearing motor.

The welder comes in 200, 300, and 400-amp models.

Another machine gives both alternating and direct current. It has a rheostat with micrometer current control within each range of the three-position switch. It is available in 200, 300 and 400-amp models, with or without power factor correction. *Write:* Air Reduction Sales Co., division of Air Reduction Co. Inc., 30 E. 42nd St., New York 17, N. Y. *Phone:* Murray Hill 2-6700

You just
SIT THE MACHINE
ON
Air-Loc
4-17-4
... and push the
START button!

NO. 21
BLISS PRESS
Installed on AIR-LOC pads without cement, bolts or lag screws. Press has been banging out production for one year without "walking."

IT'S THAT EASY... NO CEMENT TO APPLY... NO WAITING FOR IT TO DRY... NO BOLTS OR LAG SCREWS.

You just sit machines on AIR-LOC and the installation is complete. Installation and "waiting time" (for cement to dry) are cut in half. Costs for installation are the lowest known in industry today.

NOTE: The AIR-LOC method sounds so easy that some people don't believe it works. To make your own savings on machine installation, ask us for prices to cover one lathe, planer, press, etc. Put one machine on AIR-LOC and judge for yourself.

Every order is shipped same day received.

Strapping Table

Strapping heavy containers is easier with this 36-in. square table top which contains sixty-one 1-in. ball casters. They extend $\frac{3}{4}$ -in. above the table surface and are staggered on 3-in. centers.

The unit can be mounted on a permanent or portable base or in conveyor lines. A metal strap guide can be used to facilitate strap feeding. Write: Signode Steel Strapping Co., 2600 N. Western Ave., Chicago 47, Ill. Phone: Armitage 6-8500

Convection Furnaces

Temperite furnaces have a uniform temperature in all parts of the work chamber.

A high speed fan and a special alloy baffle, which directs the flow of air, assure positive forced cir-

ulation.

Heat is transferred rapidly and uniformly from the heating elements (on the sides of the work chamber) to the work.

Radiation loss is reduced by pre-formed layers of graded insulation.

Heating elements are coiled, nickel-chromium wire held in ceramic refractories. Write: Hevi-Duty Electric Co., Milwaukee 1, Wis. Phone: West 3-2756

Gear Deburring

Model BME-14 Duplex deburrs and chamfers both sides of gears or splines at the same time.

It handles spur, helical and straight-sided gears, as well as involute splines, at rates up to five teeth a second.

Depth of chamfer is infinitely variable; adjustment is made in the tool holders. Tooling can be changed in 15 minutes. Write: Modern Industrial Engineering Co., 14230 Birwood Ave., Detroit 38 Mich. Phone: Webster 3-7280

Heat-Resistant Brick

Emeri-Brick withstands heat and thermal shock, even the dropping of cupola bottoms.

It is 2.22 x 3.55 x 7.75-in. and can be placed to suit the application.

The brick is usually positioned on end (for example, in ladle

the most enduring way to ... **STOP CORROSION**

sts) for maximum protection
against heat and thermal shock.
It is placed on edge in front of
spolas, in cooling and storage
areas. In less critical heat areas,
where temperatures range from 800
to 1200° F, it is placed flat.

After grouting, curing takes 24
to 36 hours. *Write:* Walter Maguire

NEW PRODUCTS
and equipment

handled automatically through the press without any adjustment for handling the different sizes. Write Elmes Engineering Division, American Steel Foundries, 1150-X Tennessee Ave., Cincinnati 29, O. Phone Redwood 1-9210

Sectional Belt Conveyors

Pre-engineered units with capacities up to 1500 tons an hour using standard Link-Belt components, including the Series 50 belt idlers.

The conveyors are built in 18, 24, 30 and 36-in. belt widths, with 24 and 42-in.-deep trusses. Drive range up to 40 hp.

Conveyors are built in the company's plant nearest the job site and components are shop assembled for easy installation. Write Department PR, Link-Belt Co., 301 N. Michigan Ave., Chicago 1, Ill. Phone: Randolph 6-7790

Profile Miller

The Morey 50MA is equipped for hand profiling of ferrous and nonferrous metals. Also available for power feeds and tracing systems.

The spindle is driven by a 40

NEW PRODUCTS and equipment

p motor. There are 18 speeds from 44 to 4800 rpm).

Tables range from 48 x 48 in. up to 144 in. in increments of 2 ft. Write: Morey Machinery Co. Inc., 83 Lafayette St., New York 3, N. Y. Phone: Algonquin 4-6560

Mist Lubricator

MistOmatic spray control automatically applies a controlled, premeasured quantity of mist lubrication on open gears, chains, cams, rollers, eccentrics, slides and ways, circular saws and similar surfaces.

The injector spray control valves also have been used to spray premeasured amounts of lubricants, paint, glue and similar materials on production lines. Write: Industrial Division, Lincoln Engineering Co., 5702-33 Natural Bridge Ave., St. Louis 20, Mo. Phone: Evergreen 3-5900

Power Conveyor Curves

Clogging on curved conveyor lines is eliminated by chain-driven, power-roller conveyor curves.

The units can be driven from a 1/2-hp motor conveyor head shaft. The chain sprocket drive improves the flow of material. Speed of package movement can be up to 90 fpm.

A clear plastic chain guard encloses moving parts. Write: Harry J. Ferguson Co., Jenkintown, Pa.

Milling Machine

The Mill-All faces: Structural steel beams and columns, other structural steel sections and fabrications, steel and iron castings, forgings and weldments. A tilting head model chamfers plates and bars.

The machine does plate edging and can be adapted to mill alumi-

2" to 3"	11 thru 18	

Carbon 1010 to 1025

Michigan Tubing

has uniform strength, weight, ductility, I.D. and O.D., wall thickness, machinability, and weldability. It can be flanged, expanded, tapered, swaged, beaded, upset, flattened, forged, spun closed, fluted, and rolled. Available in a wide range of sizes, shapes and wall thicknesses, prefabricated by Michigan or formed and machined in your own plant.

A dominant component of a new combination washer-dryer now on the market is this condenser tube fabricated by Michigan.

In the manufacture of this important tubular part, which helped make possible a major forward step in the development of an appliance for better living, Michigan engineers were required to solve a difficult production problem. The utmost design skill and fabrication accuracy were essential.

Refer to the drawing and note the expansion required for this part and the spiral bead—operations commonly and efficiently performed with Michigan's modern fabricating equipment. The bracket is projection welded to the tube in a single high production operation—another typical example why Michigan engineers and production workers cannot be excelled in the quantity manufacture of intricate tubular products at low cost.

Always consult Michigan first on any special tubular job requiring the greatest accuracy of product and economy of manufacture.

How uses automatic finishing equipment

Binks installation at International Harvester "...paid for itself 1½ times in first year of operation."

Improving product quality by improving production methods is typical of the International Harvester Company. About one year ago International sought an economical way to speed up the coating of radiator cores for its well known tractors and trucks...and to reduce the number of rejects.

K. J. Merner, Paint Engineer at International's Melrose Park, Ill., Works, called in Binks engineers to help him and his associates solve the problem. The result is a custom-designed Binks Flo-Coat machine which, says Mr. Merner, "paid for itself 1½ times in the first year of operation."

This unusual economy is obtained by:

- (1) The finishing of radiator cores at unprecedented speeds.
- (2) Complete, uniform coating of even hard-to-get-at areas.

(3) Reduction of material waste to the minimum.

(4) Almost total elimination of rejected radiator cores.

For every industry

Almost any mass-produced product manufactured today can be finished or coated...better, faster and more economically...with Binks automatic finishing equipment.

FREE ENGINEERING HELP

Binks engineers work closely with manufacturers in the design and installation of automatic equipment that meets special requirements. Binks' long experience in this field is available to you without obligation. Just contact your nearest Binks Branch Office, or write directly to the address below:

NEW PRODUCTS and equipment

num and other nonferrous metals

Metal removal rates range from 40 to 80 cu in. a minute (with cuts up to ¾-in.). Models provide horizontal cutter travel from 70 to 144 in. and vertical cutter travel from 60 to 84 in.

Indexable-blade, carbide face mills give high cutting capacity. They can be indexed to eight cutting positions before they need regrinding.

The cutter spindle is driven by a 40-hp motor. Also available: 75-hp motor. Write: Kling Brothers Engineering Works, 1320 N. Kosner Ave., Chicago 51, Ill. Phone: Capital 7-4200

Drilling Machines

The smallest of three models in a line of adjustable-spindle machines has 12-in. wide ways, a 10-in. stroke and 7½-hp.

Another model has 18-in. wide ways, an 18-in. stroke and 15 hp. The largest model has 24-in. ways, a 24-in. stroke and 20 hp.

Each model is built with a variety of head sizes and spindle arrangements. A separate motor drives the hydraulic power unit which provides an infinite feed range and various cycling sequences. Write: Buhr Machine Tool Co., Ann Arbor, Mich. Phone: Normandy 2-5646

Thread, ring and plug gages are listed in catalog 875G, 28 pages. Metro Division, Besly-Welles Corp., Beloit, Wis.

2500 POUNDS OF PUMP RUNNER

A TYPICAL DURALOY HIGH ALLOY CASTING

This casting is 18-8, destined for use under quite corrosive conditions. It's typical of the work done in our modern foundry for both manufacturers who need high alloy castings for their equipment and for plant operators who need castings to meet a corrosion problem, a high temperature problem or a combination of both, with or without abrasion as a contributing factor.

We here at Duraloy now offer several distinctly different kinds of castings, all in the corrosion-resisting, heat-resisting or abrasion-resisting class and each kind offering certain distinct advantages:

- static sand castings
- centrifugal castings
- shell molded castings

Shell molding offers great economy in the casting of small pieces on a large mass production basis.

Bring your high alloy casting problem to Duraloy both for recommendations as to the best alloying combination and for foundry services in casting and finishing the piece. Our recommendations and service are backed up by more than thirty years high alloy casting experience.

6 reasons for checking your Commercial Heat Treater First

HE PROVIDES . . .

1

Guidance in Steel Selection and Design

2

Metallurgical Understanding of Metal Properties

3

Assistance in Proper Preparation of Parts for Heat Treating

4

Knowledge through Experience of the Right Heat Treat for the Job

5

Extensive array of Equipment and Facilities

6

Final laboratory and non-destructive Testing

Whenever your production requirements for a new product or the redesign or improvement of an old one mean the installation or expansion of heat treating activities, it will pay you to check with your Commercial heat treater before tackling the job yourself.

The 6 basic reasons for this are shown above. Remember the Commercial Heat Treater has the skill, the experience, the equipment; — all under one roof ready to serve you.

April 2, 1956

Market Outlook

STEEL SCRAP PRICES forecast a continued strong demand for steel.

In the fourth consecutive week of uptrend they jumped so sharply in the week ended Mar. 28 that they boosted STEEL's price composite on steelmaking grades of scrap \$3.67 over the preceding week. This jump pushed the composite to a new record of \$53.50 a gross ton. Previous record was \$53.33 set in January.

BELLWETHER—Scrap makes up about half the raw materials that go into a ton of new steel. So, the steel industry's fortunes shape those of the scrap industry, too. Scrap prices move up and down in anticipation of trends in steel demand and production.

Even though there are some other influences in the current rise in scrap prices, the jump is so sharp you can come to only one conclusion: Steel demand and production will be strong the rest of the year.

UPWARD FORCES—The "other" influences in the current rise of scrap prices include a reduced flow of scrap, rising prices of pig iron and increased railroad freight rates. The scrap flow shrank with the drop in automobile production. Scrap is a by-product of auto output—the fewer the cars, the lower the scrap output. Pig iron, the other big volume ingredient in new steel, is rising \$1.50 a gross ton. Since the ratio of pig iron to scrap can be varied, the price of pig iron also influences the price of scrap. Boosting pig iron prices are increased costs of raw materials and rail transportation.

COMPOSITES RISE—STEEL's price composites on pig iron moved up to \$58.93 a gross ton on

basic, \$59.42 on No. 2 foundry and \$60.55 on malleable. They had been \$58.49 on basic, \$58.99 on No. 2 foundry and \$59.77 on malleable.

STEEL's price composite on finished steel holds at \$128.02 a net ton.

In the Seattle area, interest in export scrap has increased, and foreign buyers evidently are convinced that further price recession is unlikely. Several cargoes were reportedly sold to Japan.

STEADY—The automobile industry, the only major steel consumer that reduced its pressure of demand for steel this year, is unlikely to ease up any further in the near future. Passenger auto makers' schedules for April, May and June exceed the first quarter by 2.1 per cent.

PROTECTION—Auto producers are reported to be putting steel into inventory. They are protecting themselves against steel price increases, a possible strike of steelworkers and laying in steel for what they hope will be a big sales spurt, come the 1957 models.

BOOKED UP—Some forms of steel look to be in tight supply for a long time to come. Promises on structural steel deliveries extend 12 months and longer in many cases. On a New York institutional project requiring 1300 tons of structurals, no fabricator who bid on them quoted deliveries in less than 12 months.

In trying to supply demand, producers continued to turn out steel for ingots and castings at 98.5 per cent of capacity. Producers are hampered by necessity to repair furnaces, whose lives are shortened by the fast pace of production.

What You Can Use the Markets Section for:

• A source of price information.

Current prices are reported each week. Price changes are shown in italics. Price trends are shown in tables of indexes and comparisons.

• A directory of producing points.

Want to know who makes something, or where it is made? The steel price tables alphabetically list the cities of production and indicate the producing company. If you are a buyer, you may want to make a map showing comparative distances of sources of supply and to help you compute freight costs. If you are a seller of supplies you can make a map to spot your sales possibilities.

• A source of price data for making your own comparisons.

Maybe you want to keep a continuous record of price spread between various forms of steel. You can get your base price information from STEEL's price tables.

• A source of information on market trends.

Newsy items tell you about the supply-demand situation of materials, including iron and steel, nonferrous metals and scrap. Other articles analyze special situations of interest and importance to you.

• Reports on iron and steel production, and materials and product shipments.

20% reduction in Inventory Space

90% reduction in Operating Personnel

... with ECONOMY elevating transfer cars

Heavy jet turbine engine subassemblies are handled with push button ease on Economy elevating transfer cars.

These transfer cars take the palletized assemblies from inspection area and move them on tracks to the appropriate tier. The operator raises and transfers the pallet to the selected stock tier. Another Economy transfer car on the other side of the storage tier removes pallets to the final assembly line. This system guarantees inventory turnover on a first-in-first-out basis.

The system operates with smooth effortless automation and with no danger of damage to the fabricated assemblies. This Economy transfer car system with the resulting reduction of operating personnel and the complete utilization of inventory space is a unique factor in cost saving operations.

For over 50 years Economy has been engineering and building special lifting and Hi-Reach service machines. Our engineers have constantly improved the mechanical construction to obtain maximum strength and safety. —**What is your problem?**—

Nonferrous Metals

U. S. primary aluminum producers raise prices on all grades to help create expansion capital. Another hike could come after labor negotiations in May and June

Nonferrous Metal Prices, Pages 130 & 131

ALUMINUM PRICES jumped on Mar. 26 for the first time since Aug. 8, 1955. Kaiser Aluminum & Chemical Corp. led the parade by announcing a 1.5-cent-a-pound increase (primary ingot to 25.90 cents per pound) on all grades.

Reynolds Metals Co. followed suit on Mar. 27. Some of Reynolds' reasons for raising prices: 1. The aluminum industry currently is operating around the clock. It must expand. 2. Cost of building new primary facilities runs about \$1500 per ton of capacity. This is about five times greater than the cost per ton of new steel capacity. 3. Government incentives have been withdrawn. And adds Richard S. Reynolds Jr., president: "Since 1939, weekly earnings of employees have risen more than 200 per cent."

Alcoa, Too—Aluminum Co. of America made its move on Mar. 29, following the pattern set by Kaiser. Aluminium Ltd. is still studying the situation.

Outlook — Everyone will raise aluminum prices. It is just a matter of time. Look for Aluminium to follow quickly so that the stage will be set for another round of price hikes as soon as labor negotiations are concluded in May and June.

Texas Smelter Will Close

The tin market continues to dip gradually (about 98.5 cents per pound). Some tin men point out that this may be a temporary situation caused in part by the falling copper prices on the LME. Others contend that tin is getting back to its normal price.

President Eisenhower will definitely recommend that the Texas City tin smelter be closed. Even though it is an election year, Texas politicians may have a difficult time keeping the smelter in operation as Congress will have to enact a new law rather than pass a resolution. It is estimated that this project is costing the government \$10 million a year.

Copper: LME Price Nose Dives

Kennecott Copper Corp. officials are in Chile attempting to come to

an agreement which will allow Kennecott to keep its Chilean and domestic production at the 46-cents-a-pound level. With the plummeting London Metal Exchange prices for the red metal (down to about 49 cents a pound), Kennecott is in a good position to drive a hard bargain.

The battle over whether the copper industry should go to world prices continues. One observer told STEEL: "We can't. How would mill people be able to judge price when they have to buy at least 60 days in advance?"

Some industry spokesmen feel that if the primary producers would go to a world price, copper might dip to 40 cents a pound. Look for March production statistics to bring a sobering influence to the market, too. Indications are that primary copper production reached a record.

Titanium Comes of Age?

The significant fact in Titanium Metals Corp. of America's expansion announcement is that its sponge capacity will be raised from 3600 to

6000 tons without government aid in the form of contractual guarantee. It is a vote of confidence by National Lead Co. and Allegheny Ludlum Steel Corp. (joint owners) for titanium's future. Look for other primary producers to announce expansion plans as orders continue to stack up.

Magnesium Shows Gains

Magnesium boosters are growing more optimistic. Preliminary estimates indicate that primary production is close to industry capacity. There are growing indications that the current 75,000-ton capacity may be upped 10 per cent by adding more power to the lines before the year ends. Reasons for optimism: 1. Civilian and military applications are growing. 2. Last year about 2 per cent of all magnesium production went to the aluminum industry. And aluminum continues to expand. 3. It takes a pound of magnesium to produce a pound of titanium by the Kroll process.

Nickel Problems Continue

The Office of Defense Mobilization released 18 million lb of nickel from scheduled stockpile delivery on Mar. 21. This means that the hungry military machine will be satisfied. Civilian users will get no more nickel. ODM indulged in some double talk when it stated that the normal amount (500,000 lb) of Nicaraguan nickel oxide would be available. It is well known that for the past two or three months over 2 million lb of Nicaraguan oxide have been placed in users' hands each month.

It is growing close to the time when John R. Townsend (selected by ODM to survey the nickel industry) will submit his report. Rumors say that he will recommend that the government reduce stockpiling goals and support a secondary source of supply.

Lead and Zinc Demand Firm

"They'll hold their own," reports one producer. "Both metals are running ahead of last year's sales totals for the first quarter but are behind for the fourth quarter sales peaks." Specific high grade zinc sales are off, but industry men point to rising autosales as the solution to this problem. Outlook: Regardless of automaker production, lead and zinc will have near record years.

TALK, LOOK AND LISTEN WITH

Newport Steel

Essential elements in the nation's communication systems are the Newport Steel products used in manufacturing equipment for telegraph and telephone, radio and television, printing, publishing and daily mail. Many other industries also rely upon Newport's precision operations to supply quality materials that go to serve government, armed forces, industry and home. Strategically located in the heart of America's greatest industrial development, this 70-year-old organization has the modern facilities and experienced personnel to deliver every order to exact specifications and make Newport Steel the most logical source for your requirements.

ECONOMICAL WATER-RAIL-TRUCK DELIVERY

Newport Steel is ideally situated on the Mississippi-Ohio River system and the great Cincinnati rail-truck hub. New barge facilities, 7 major railroads, and 143 motor carriers enable Newport to give economical, dependable delivery to the entire area of the Middle West and South.

Cents per pound, carlots, except as otherwise noted

PRIMARY METALS AND ALLOYS

Aluminum: 99 + %, ingots, 24.40-25.90; pigs, 22.50-24.00, 10,000 lb or more, f.o.b. shipping point. Freight allowed on 500 lb or more.

Aluminum Alloy: No. 13, 12% Si, 26.20-27.70; No. 43, 5% Si, 26.00-27.50; No. 142, 4% Cu, 1.5% Mg, 2% Ni, 28.20-29.70; No. 195, 4.5% Cu, 0.8% Si, 27.60-29.10; No. 214, 3.8% Mg, 27.80-29.30; No. 356, 7% Si, 0.3% Mg, 26.20-27.70.

Antimony: R.M.M. brand, 99.5%, 33.00; Lone Star brand, 33.50, f.o.b. Laredo, Tex., in bulk. Foreign brands, 99.5%, 27.00-28.00, New York, duty paid, 10,000 lb or more.

Beryllium: 97%, lump or beads, \$71.50 per lb. f.o.b. Cleveland or Reading, Pa.

Beryllium Aluminum: 5% Be, \$74.75 per lb of contained Be, f.o.b. Reading, Pa., Elmore, O. **Beryllium Copper:** 3.75-4.25% Be, \$43 per lb of contained Be, with balance as Cu at market price on shipment date, f.o.b. Reading, Pa., or Elmore, O.

Bismuth: \$2.25 per lb ton lots.

Cadmium: Sticks and bars, \$1.70 per lb deld.

Cobalt: 97-99%, \$2.60 per lb for 550-lb keg; \$2.62 per lb for 100-lb case; \$2.67 per lb under 100 lb.

Columbium: Powder, \$119.20 per lb, nom.

Copper: Electrolytic, 46.00 deld. Conn. Valley; 46.00 deld. Midwest; custom smelters, 50.50 deld.; Lake, 46.00 deld.; Fire refined, 45.75 deld.

Germanium: First reduction, \$201.85-\$220 per lb; intrinsic grade, \$220-\$242.67 per lb, depending on quantity.

Gold: U. S. Treasury, \$35 per oz.

Indium: 99.9%, \$2.25 per troy oz.

Iridium: \$100-\$110 nom. per troy oz.

Lead: Common, 15.80; chemical, 15.90; corroding, 15.90, St. Louis. New York basis, add 0.20.

Lithium: 99+, cups or ingots, \$11.50; rod \$13.50; shot or wire, \$14.50, f.o.b. Minneapolis, 100 lb lots.

Magnesium: Pig, 32.50 f.o.b. Velasco, Tex.; ingot, 33.25 f.o.b. Velasco, Tex.

Magnesium Alloys: AZ91B (diecasting), 31.00 deld.; AZ63A, AZ92A, AZ91C (sand castings), 36.00 f.o.b. Velasco, Tex.

Mercury: Open market, spot, New York, \$258-\$260 per 76-lb flask.

Molybdenum: Powder, 99% hydrogen reduced, \$3.20 per lb; pressed ingot, \$4.06 per lb; sintered ingot, \$5.53 per lb.

Nickel: Electrolytic cathodes, sheets (4 x 4 in. and larger), unpacked, 64.50; 10-lb pigs, unpacked, 67.65; "XX" nickel shot, 69.00; "F" nickel shot or ingots for addition to cast iron, 64.50; prices f.o.b. Port Colborne, Ont., including import duty. New York basis, add 0.92.

Osmium: \$80-\$100 per troy oz, nom.

Palladium: \$23-\$24 per troy oz.

Platinum: \$97-\$111 per troy oz from refineries.

Radium: \$16-\$21.50 per mg radium content, depending on quantity.

Rhodium: \$118-\$125 per troy oz.

Ruthenium: \$45-\$55 per troy oz.

Selenium: 99.5%, \$13.50-\$15.50 per lb.

Silver: Open market, 91.25 per troy oz.

Sodium: 16.50, c.l.; 17.00 l.c.l.

Tantalum: Sheet, rod, \$68.70 per lb; powder, \$56.63 per lb.

Tellurium: \$1.50-\$1.75 per lb.

Thallium: \$12.50 per lb.

Tin: Straits, N. Y., spot, 100.50; prompt, 100.375.

Titanium: Sponge, 99.3+ %, grade A-1 ductile (0.3% Fe max), \$3.45; grade A-2 (0.5% Fe max), \$3.15 per pound.

Tungsten: Powder, 98.8%, carbon reduced, 1000-lb lots, \$4.50 per lb, nom., f.o.b. shipping point; less than 1000 lb add 15.00; 99 + % hydrogen reduced, \$5.00. Treated ingot, \$6.70.

Zinc: Prime Western, 13.50; brass special, 13.75; intermediate, 14.00, East St. Louis, freight allowed over 0.50 per pound. High grade, 14.85; special high grade, 15.25 deld. Diecasting alloy ingot No. 3, 18.00; No. 2, 19.00; No. 5, 18.50, deld.

Zirconium: Ingots, commercial grade, \$14.40 per lb; low-hafnium reactor grade, \$23.07. Sponge, commercial grade, \$7.50-\$10.00 per lb, depending on quantity; reactor grade, \$14.00-\$22.00 per lb, depending on quantity. Powder, electronics grade, \$15 per lb; flash grade, \$11.50.

(Note: Chromium, manganese and silicon metals are listed in ferroalloy section.)

SECONDARY METALS AND ALLOYS

Aluminum Ingot: Piston alloys, 31.75-33.75; No. 12 foundry alloy (No. 2 grade), 30.00-31.00; 5% silicon alloy, 0.60 Cu max, 32.00-32.25; 13 alloy, 0.60 Cu max, 32.00-32.25; 195 alloy, 32.00-32.25; 108 alloy, 30.50. Steel deoxidizing grades, notch bars, granulated or shot: Grade 1, 30.50-31.00; grade 2, 29.00-30.00; grade 3, 29.00-29.50; grade 4, 28.00-28.50.

Brass Ingot: Red brass, No. 115, 44.00; tin bronze, No. 225, 58.00; No. 245, 50.75; high-leaded tin bronze, No. 305, 47.75; No. 1 yellow, No. 405, 34.75; manganese bronze, No. 421, 39.25.

Magnesium Alloy Ingot: AZ63A, 34.00; AZ91B, 34.00; AZ91C, 34.00; AZ92A, 34.00.

NONFERROUS MILL PRODUCTS

BERYLLIUM COPPER

(Base prices per lb, plus mill extras, 2000 to 5000 lb. f.o.b. Temple, Pa.; nominal 1% Be alloy) Strip, \$1.92; rod, bar, wire, \$1.89.

19.50-20.50; new brass clippings, 28.00-28.50; light brass, 19.00-19.50; heavy yellow brass, 21.50-22.00; new brass rod ends, 26.50-27.00; auto radiators, unsweated, 24.00-24.50; cocks and faucets, 24.50-25.00; brass pipe, 25.00-25.50.

Lead: Heavy, 12.75-13.00; battery plates, 6.50-6.75; linotype and stereotype, 14.00-14.50; electrolytic, 13.25-13.75; mixed babbit, 15.50.
Magnesium: Clippings, 13.50-19.50; clean castings, 13.00-19.00; iron castings, not over 10% removable Fe, less full deduction for Fe, 16.00-17.00.

Monel: Clippings, 60.00-70.00; old sheets, 55.00-70.00; turnings, 50.00; rods, 59.50-70.00.
Nickel: Sheets and clips, 100.00-150.00; rolled anodes, 100.00-150.00; turnings, 85.00-125.00; rod ends, 100.00-150.00.

Zinc: Old zinc, 6.00-6.50; new die-cast scrap, 6.00; old die-cast scrap, 3.50.

REFINER'S BUYING PRICES

(Cents per pound, carlots, delivered refinery)

Aluminum: 1100 clippings, 23.00-23.25; 3003 clippings, 23.00; 6151 clippings, 22.75; 5052 clippings, 22.75; 2014 clippings, 22.00-22.75; 2017 clippings, 22.00-22.75; 2024 clippings, 22.00-22.50; mixed clippings, 22.00-22.50; old sheet, 20.50-21.00; old cast, 20.50-21.00; clean old cable (free of steel), 22.75-23.00; borings and turnings, 20.50-21.50.

Beryllium Copper: Heavy scrap, 0.020-in. and heavier, not less than 1.5% Be, 68.00; light scrap, 63.00; turnings and borings, 43.00.

Copper and Brass: No. 1 heavy copper and wire, 43.50; No. 2 heavy copper and wire, 42.00; light copper, 39.75; refinery brass (60% copper) per dry copper content, 40.00.

INGOTMAKERS' BUYING PRICES

(Cents per pound, carlots, delivered)

Copper and Brass: No. 1 heavy copper and wire, 43.50; No. 2 heavy copper and wire, 42.00; light copper 39.75; No. 1 composition borings, 34.00; No. 1 composition solids, 34.50; heavy yellow brass solids, 25.00; yellow brass turnings, 24.00; radiators, 26.50.

PLATING MATERIAL

(F.o.b. shipping point, freight allowed on quantities)

ANODES

Cadmium: Special or patented shapes, \$1.70 per lb.

Copper: Flat-rolled, 66.79; oval, 65.92, 5000-10,000 lb; electrodeposited, 64.25, 2000-5000 lb lots; cast 63.54, 5000-10,000 lb quantities.

Nickel: Depolarized, less than 100 lb, \$1.015; 100-499 lb, 99.50; 500-4999 lb, 95.50; 5000-29,999 lb, 93.50; 30,000 lb, 91.50. Carbonized, deduct 3 cents a lb. All prices eastern delivery, effective Jan. 1, 1955.

Tin: Bar or slab, less than 200 lb, \$1.175; 200-499 lb, \$1.160; 500-999 lb, \$1.155; 1000 lb or more, \$1.150.

Zinc: Balls, 21.00; flat tops, 21.00; flats, 22.75; ovals, 22.00, ton lots.

CHEMICALS

Cadmium Oxide: \$2.15 per lb, in 100-lb drums.
Chromic Acid: Less than 10,000 lb, 28.50; over 10,000 lb, 27.50.

Copper Cyanide: 100 lb, 85.25; 200 lb, 84.50; 300 lb, 84.25; 400-900 lb, 83.50; 1000 lb, 81.50.

Copper Sulphate: 500-1900 lb, 17.90; 2000-5900 lb, 15.90; 6000 lb or more, 15.65.

Nickel Chloride: 100 lb, 46.50; 200 lb, 44.50; 300 lb, 43.50; 400-4900 lb, 41.50; 5000-9900 lb, 39.50; 10,000 lb and over, 38.50. All prices eastern delivery, effective Jan. 1, 1955.

Nickel Sulphate: 100 lb, 38.25; 200 lb, 36.25; 300 lb, 35.25; 400-4900 lb, 33.25; 5000-35,900 lb, 31.25; 36,000 lb, 30.25. All prices eastern delivery, effective Jan. 1, 1955.

Silver Cyanide: (Cents per ounce) 4-oz bottle, 86.875; 15-oz bottle, 85.625; 80-oz bottle, 83.125; 100-oz bottle, 83.125; f.o.b. St. Louis. New York and Los Angeles. Effective Sept. 30, 1955.

Sodium Cyanide: Egg, under 1000 lb, 19.80; 1000-19,900 lb, 18.50; 20,000 lb, and over, 17.80; granular, add 1-cent premium to above.

Sodium Stannate: Less than 100 lb, 70.90; 100-600 lb, 62.50; 700-1900 lb, 60.00; 2000-9900 lb, 58.30; 10,000 lb or more, 57.10.

Stannous Chloride (anhydrous): Less than 25 lb, \$1.677; 25 lb, \$1.327; 100 lb, \$1.177; 400 lb, \$1.153; 5200-19,600 lb, \$1.031; 20,000 lb, 90.90.

Stannous Sulphate: Less than 50 lb, \$1.304; 50 lb, \$1.004; 100-1900 lb, 98.40; 2000 lb or more, 96.40.

Zinc Cyanide: Under 1000 lb, 54.30; 1000 lb and over, 52.30.

AIR LIFT

for heavy materials

Crowded isles and sluggish flow of materials cost you money. So why not go over the top!

You can speed production, cut your costs with

Conco Cranes, custom designed for your specific needs.

Let us show you how. Write for a trained

Conco engineer to call and make recommendations,

or request bulletin 3000A covering our

complete Conco line. Conco Cranes are backed

by 37 years of experience.

METAL POWDER

(Per pound f.o.b. shipping point in ton lots for minus 100 mesh, except as noted)	
Sponge iron:	
98 1/2% Fe, annealed	9.25
Swedish, c.i.f., Camden, N. J., c.i.f. in bags	9.50
Domestic:	
f.o.b. Johnstown, Pa., Riverton, N.J., Niagara Falls, N.Y., in bags	9.50
Canadian, f.o.b. shipping point	9.50
Electrolytic iron:	
Melting stock, 99.9% Fe, irregular fragments of 1/2 in. x 1.3 in.	26.50
Annealed, 99.5% Fe, 36.00	
Unannealed (99+ % Fe)	34.00
Unannealed (99+ % Fe) (minus 325 mesh)	57.00
Powder Flakes (minus 16, plus 100 mesh):	31.00
Carbonyl Iron:	
98.1-99.9%, 3 to 20 microns, depending on grade, 86.00-275.00, in standard 200-lb. containers; all minus 200 mesh.	
Aluminum:	
Atomized, 500 lb. drum frgmt. allowed	34.50
Carlots	36.50
Ton lots	36.50

(17) Flats only; 0.25 in. & heavier.	(33) To jobbers, deduct 20c.
(18) To dealers.	(34) 9.60c for cut lengths.

Typical of the finish on all Toledo Scales is that on this full height portable unit.

BOTH STEEL AND ALUMINUM PARTS ARE PROCESSED IN THE SAME 6-STAGE MACHINE AT TOLEDO SCALE

Steel parts are Granodized, aluminum parts are Alodized to inhibit corrosion and provide an excellent base for the high-grade finish used on these familiar products

Toledo Scale knows that the fundamental prerequisite of a good paint job is a properly prepared base material upon which the finish is to be applied. To provide this all-important base, it Granodizes most steel parts with Granodine® and Alodizes most aluminum parts with Alodine®. Granodizing is a chemical process for the treatment of iron and steel which converts metallic surfaces to a nonmetallic coating of the proper texture for inhibiting corrosion and

greatly increasing the adhesion and durability of the paint finish. Alodizing performs the same functions on aluminum parts.

Both of these processes are performed in the same 6-stage machine. And both add to the long life of the Toledo finish. Perhaps these ACP processes can be used effectively in your plant. Complete data about both of them are available upon request. Write us.

Part of 6-stage machine in Granodizing Department at Toledo Scale Co.

Source: Metal Powder Association

19,200 tons, and friction materials took 2100 tons. Magnetic cores required over 1000 tons of powdered iron. Nearly 700 tons of lead powder were used in lubricants. Graphite metal brushes consumed about 850 tons of copper powder.

Over 30 Kinds—"When we consider that MPA's Data Sheet on Available Metal Powders shows some 30 different powders and that many of those cover a variety of alloy compositions, we can only begin to realize how important powder metallurgy has become," says Mr. Ziegfeld.

The association is holding its annual meeting in Cleveland at the Hotel Cleveland next week, Apr. 10 to 12. The meeting will include not only technical sessions but also a show where powder producers, parts fabricators and press, furnace and other manufacturers will show their products.

Stainless Steel . . .

Stainless Steel Prices, Page 136

Officials of Washington Steel Corp., Washington, Pa., are receiving favorable reports from distributors, after they lowered the price of type 430 stainless steel sheets \$45 per ton last week. The company points out that type 430 can be used in such fields as production of appliances and cars, where type 302 is used.

Sheets, Strip . . .

Sheet & Strip Prices, Pages 133 & 134

Some leading sheetmakers are entering the second quarter with arrears of almost a month in both hot and cold-rolled sheets. This situation exists despite automotive cutbacks and determined efforts to bring commitments into balance with supplies. Carry-overs, however, will be the lightest in at least nine months.

Producers generally do not appear concerned over their ability to keep production going full tilt throughout the second quarter. The only possible reason why production can't be maintained at capacity pace will be operational difficulties.

Supply and demand are in good balance in galvanized sheets. But orders for this product are beginning to show a seasonal pickup. Demand for enameling stock and electrical sheets is strong; also for chrome nickel sheets, with far more inquiry than can be promptly handled.

Various buyers, including automotive, who, earlier in the year had either cut back on their orders, or had shown no interest in obtaining more tonnage than they were scheduled to receive, now are endeavoring

Metal Powder Use Grows

Iron leads the way, but new uses are being found for other metals as powder metallurgy establishes itself as one of the important processes of industry

SHIPMENTS of metal powder in 1955 increased nearly 63 per cent over 1954, and powder metallurgy still is growing by leaps and bounds, declares the Metal Powder Association, New York.

Robert L. Ziegfeld, secretary of the association, says that 57,035 tons of the principal powders—iron, grain copper, copper-base alloys, lead and solder—were shipped last year, compared with only 35,030 tons the year before. While all powdered metals have contributed to this rapid growth, iron powder has made the most spectacular gains.

Big Leap—MPA figures show that in 1943 only 2135 tons of the black powder were shipped, all of it domestically produced (see table above). Since that time, the tonnage has increased about 16 times. As the market began to grow after World War II, consumers had to import the powder, and today about one-third of our supply still comes from abroad. But the domestic industry has added to its capacity and now supplies about ten times the tonnage it did 12 years ago.

The association made a survey in late 1954 which indicated that domestic capacity to produce iron powder

was well in excess of even 1955 requirements. "Domestic capacity is estimated at a little over 50,000 tons, including some capacity which needs at least some additional equipment to bring it into production. The gap between production and capacity is still large, therefore, although the industry's growth is closing that gap," Mr. Ziegfeld says.

Reasons—Two factors are paramount in the growth pattern in 1955, Mr. Ziegfeld states. "First, since the use of iron powder for bearings and parts grew about in proportion to the total, the high level of business, particularly in the automotive industry, and the use of powder metallurgy for more and more different parts must have been major factors. Second, new uses—like welding rod flux coatings and cutting and scarfing of steel and concrete, which are growing tremendously—upped the miscellaneous classification also about in proportion to the total growth."

Last year, bearings and parts consumed 33,100 tons of the total shipments, accounting for about half the domestic iron powder and two-thirds of the copper powder. Miscellaneous uses, which include welding rods and cutting and scarfing, accounted for

How
SHENANGO
CENTRIFUGAL
CASTINGS
pay off!

CENTRIFUGALLY CAST FOR PRESSURE SERVICE. This large sluice gate operating cylinder, assembled by precise shrink fit as shown here, will safely handle pressures up to 250 psi. The Meehanite Metal cylinder housing, sleeved with a bronze liner 20" in diameter . . . are both centrifugally cast by Shenango for increased tensile strength and improved resistance to wear, stress and abrasion. For complete information on rough finished, semi-machined or precision-machined parts, ferrous or non-ferrous, write to: Shenango-Penn Mold Company, Centrifugal Castings Division, Dover, Ohio.

to increase their orders, but without much success.

An easing in sheet supply may develop in the third quarter due to seasonal influences, and because of heavy second quarter buying as a hedge against a possible steel strike this summer and likely higher prices at midyear.

Tubular Goods . . .

Tubular Goods Prices, Page 136

Merchant pipe sales are increasing seasonally for construction applications. Miscellaneous industrial requirements also are high, due to generally high-level industrial activity.

Oil country tubemakers set some individual plant production records in February. Users are preparing for a record-breaking year of well drilling.

Cast iron pipe sellers anticipate a sharp seasonal pickup in buying. Last week's awards in the Pacific Northwest were reported in excess of 500 tons. Substantial tonnage in small lots is moving out of stock.

Ferroalloys . . .

Ferroalloy Prices, Page 145

New Jersey Zinc Co. has advanced prices on all grades of spiegeleisen \$2.50 a gross ton, effective with April shipments. Under the new schedule, the 16-19 per cent manganese grade has been increased to \$92, Palmerston, Pa., 19-21 to \$94, and 21-23 to \$96.50. Change reflects higher costs, and brings the market more in line with ferromanganese, on which increases were recently announced. The last advance on spiegeleisen amounted to \$3.50 and was announced Dec. 15, 1955, on shipments on and after Jan. 1, this year.

Steel Bars . . .

Bar Prices, Page 132

Hot-rolled carbon bar producers have reduced arrearages to the lowest point in about a year. Still, they are two to three weeks behind on commitments, and whether they will be able to draw any closer in the course of the second quarter is doubtful.

Some mills report they are well booked up through the second quarter. Others, however, are looking for business. In general, despite the slowdown in automotive demand, supplies continue tight, except that the situation is a little easier in the case of cold-finished tonnage.

Small bars, 7/8-in. rounds and under, are in noticeably tight supply in the East. So are the nickel-bearing alloys. Some producers are un-

**Radiography
says "OK"
to machine"**

**...and protects
the customer's
investment**

The blank for this stainless steel jet engine part starts as a mill rolled bar, is shaped under heat and pressure, and flash-welded to form a homogeneous ring. Any porosity or lack of fusion could put the part in the scrap-heap—scrapping with it the buyer's investment of machining time which is five times the cost of the blank itself.

To guard its customers against such losses, The American Welding & Manufacturing Co., Warren, Ohio, makes extensive use of radiographic inspection.

Only rings with welds *proved* sound are delivered to the buyer. Possible loss of machining time—with costs as great as \$300—is avoided at the outset.

Radiography does a great job for welding. It saves time and money as in this case. It gives customers great confidence and peace of mind. It opens new applications where the welding process was once frowned on.

Radiography can help you build business. If you would like to know how, talk it over with your x-ray dealer.

51 a

able to promise delivery in less than 12 weeks, even on rated tonnage. Promises on the nonnickel bearing hot alloys range four to five weeks where no extra processing is involved. A shade better might be done in a few instances.

Plates . . .

Plate Prices, Page 132

No easing in plate supply appears in prospect for months. Producers still are turning away tonnage business and believe that they will be faced with more inquiry than they can handle throughout the remainder of the year. This view is predicated largely on prospects for continued active needs for heavy building construction, railroad car equipment, tanks and line pipe, industrial equipment and machinery and increasing needs for shipbuilding.

Wire . . .

Wire Prices, Pages 134 & 135

Automotive cutbacks have resulted in a shift in product mix at one major wire plant in the Pittsburgh area. Spring manufacturers reduced their purchases of high-carbon wire in March and April. Some of this slack is being taken up by heavier demand from furniture makers. Most of the excess tonnage is being taken by low-carbon users, such as appliance producers and miscellaneous wire-forming shops.

Producers of manufacturers wire have backlogs averaging about 60 days. Some third quarter orders for special types have been placed. Backlogs are noticeably heavy in all types of wire required for reinforcing. Indications are consumers are building inventories. Most consumers in New England are not buying much tonnage in anticipation of higher prices or a possible steel strike.

Structural Shapes . . .

Structural Shape Prices, Page 132

Structural steel delivery promises extend 12 months and longer in many cases. Some of the smaller shops can do better, but the average delivery time is becoming more extended.

On a recent 1300-ton institutional project in the East, none of the fabricators who quoted bid less than months.

While considerable work is being figured, awards are relatively light. This is particularly true of Pennsylvania state bridge work. Following a brisk start in January, when more than 19,000 tons came out for figuring, inquiry dropped sharply to little more

ASK THE MAN FROM **ANACONDA**
FOR INTERLOCKED-ARMOR CABLE

Anaconda Interlocked-armor cable comes in sizes No. 6 Awg to 750 Mcm—copper or aluminum—up to 15 kv—Underwriters' approval for 600 volts and 5000 volts. Available with rubber-, plastic- or varnished-cambric-type insulation.

SOLVE

your tough lifting
problems with

**JOB-
ENGINEERED**

Yellow Strand

BRAIDED SAFETY SLINGS!

Broderick & Bascom have engineered hundreds of different Yellow Strand Safety Slings for every kind of lifting application. Your own particular lifting problem may be more unusual, more difficult. But you can count on the experience, the know-how and modern facilities of B & B to solve it with the safest, most efficient and longest-lasting Yellow Strand Sling.

Broderick & Bascom Rope Co. are specialists in safety slings. There's no load too small or too large . . . no load, no matter how it's shaped, that can't be handled quickly, easily and safely by *job-engineered* Yellow Strand Braided Safety Slings.

And because B & B make these slings specifically for your application, they do the job quicker, give longer, trouble-free service. And it's easy to order Yellow Strand Safety Slings. You just give us the shape and weight of the material—we'll figure out the rest. See your Yellow Strand Distributor or write to Broderick & Bascom Rope Co., 4203 Union Blvd., St. Louis 15, Mo.

MANGANESE ALLOYS

Negeleisen: Carlot, per gross ton, Palmerton, Pa. 21-23% Mn, \$96.50; 19-21% Mn, 1-3% Si, 14-16-19% Mn, \$92.

Standard Ferromanganese: (Mn 74-76%, C 7% approx.) Base price per net ton \$205. Duquesne, Johnstown, Sheridan, Pa.; Philo, O.; Acoma, Wash.; Alloy, W. Va.; Ashtabula, Marietta, O.; Sheffield, Ala.; Portland, Ore. Add or subtract \$2 for each 1% or fraction thereof of contained manganese over 76% or under 74%, respectively.

Mn 79-81%. Lump \$213 per net ton, f.o.b. Maconada or Great Falls, Mont. Add \$2.60 for each 1% above 81%; subtract \$2.60 for each percent below 79%, fractions in proportion to nearest 0.1%.

Low-Carbon Ferromanganese, Regular Grade: (Mn 85-90%). Carload, lump, bulk, max. 0.07% C, 31.95c per lb of contained Mn, carload packed 33c, ton lots 34.5c, less ton 5.7c. Delivered. Deduct 1.5c for max 0.15% grade from above prices, 3c for max 0.30% C, 3.5c for max 0.50% C, and 6.5c for max 5% C—max 7% Si. **Special Grade:** (Mn 90% min, C 0.07% max, P 0.06% max). Add 2.05c to the above prices. Spot, add 0.25c.

Medium-Carbon Ferromanganese: (Mn 80-85%, C 1.25-1.5%, Si 1.5% max). Carload, lump, bulk 22.5c per lb of contained Mn, packed, carload 23.9c, ton lot 25.5c, less ton 26.7c. Delivered. Spot, add 0.25c.

Manganese Metal: 2" x D (Mn 95.5% min, Fe 4.5% max, Si 1% max, C 0.2% max). Carload, lump, bulk, 45c per lb of metal; packed, 4.75c; ton lot 47.25c; less ton lots 49.25c. Delivered. Spot, add 2c.

Electrolytic Manganese Metal: Min carload, 1.5c; 2000 lb to min carload, 33.5c; 250 lb to 999 lb, 35.5c. Premium for hydrogen-removed metal, 0.75c per lb. Prices are f.o.b. cars, Knoxville, Tenn., freight allowed to St. Louis or to any point east of Mississippi; or f.o.b. Marietta, O., freight allowed.

Alumomanganese: (Mn 65-68%). Contract, lump, bulk 1.50% C grade, 18-20% Si, 12c per lb of alloy. Packed, c.l. 13c, ton 13.45c, less ton 14.45c, f.o.b. Alloy, W. Va., Ashtabula, O., Marietta, O., Sheffield, Ala., Portland, Ore. For 2% C grade, Si 15-17%, deduct 0.2c from above prices. For 3% C grade, Si 12-14.5%, deduct 0.4c from above prices. Spot, add 0.25c.

TITANIUM ALLOYS

Ferrotitanium, Low-Carbon: (Ti 20-25%, Al 3.5% max, Si 4% max, C 0.10% max). Contract, ton lots 2" x D, \$150 per lb of contained Ti; less ton \$155. Ti 38-43% Al 3% max, Si 4% max, C 0.10% max). Ton lots \$1.35, less ton \$1.37 f.o.b. Niagara Falls, N. Y., freight allowed to St. Louis. Spot, add 5c.

Ferrotitanium, High-Carbon: (Ti 15-18%, C 5-8%). Contract \$200 per ton, f.o.b. Niagara Falls, N. Y., freight allowed to destinations east of Mississippi river and north of Baltimore and St. Louis.

Ferrotitanium, Medium-Carbon: (Ti 17-21%, C 2.4-5%). Contract \$225 per ton, f.o.b. Niagara Falls, N. Y., freight not exceeding St. Louis rate allowed.

CHROMIUM ALLOYS

High-Carbon Ferrochrome: Contract, c.l. lump, bulk 28.25c per lb of contained Cr; c.l. packed 27.5c, ton lot 29.25c, less ton 30.65c. Delivered. Spot, add 0.25c.

Low-Carbon Ferrochrome: (Cr 67-71%). Contract, carload, lump, bulk, C 0.025% max (Simplex) 31.75c per lb contained Cr, 0.02% max 38.50c, 0.03% max 38c, 0.06% max 36.50c, 0.1% max 36c, 0.15% max 35.75c, 0.2% max 35.50c, 0.5% max 35.25c, 1.0% max 34c, 1.5% max 33.85c, 2.0% max 33.75c. Ton lot, add 3.1c, less ton add 4.8c. Carload packed add 1.45c. Delivered. Spot, add 0.25c.

Foundry Ferrochrome, High-Carbon: (Cr 82-86%, C 5-7%, Si 7-10%). Contract, c.l. 2 in. x D, bulk 27.4c per lb contained Cr. Packed, c.l. 28.7c, ton 30.5c, less ton 32c. Delivered. Spot, add 0.25c.

Foundry Ferrochrome, Low-Carbon: (Cr 50-54%, Si 28-32%, C 1.25% max). Contract, carload, packed 8 M x D, 19.6c per lb of alloy, ton lot 20.85c; less ton lot, 22.05c. Delivered. Spot, add 0.25c.

Low-Carbon Ferrochrome-Silicon: (Cr 39-41%, Si 42-49%, C 0.05% max). Contract, carload, lump, 4" x down and 2" x down, bulk, 39.05c per lb of contained Cr; 1" x down, bulk 39.8c. Delivered.

Chromium Metal, Electrolytic: Commercial grade (Cr 99.8% min, metallic basis, Fe 0.2 max). Contract, carlot, packed 2" x D plate (about 3/4" thick) \$1.25 per lb, ton lots \$1.27, less ton lots \$1.29. Delivered. Spot, add 5c.

VANADIUM ALLOYS

Ferrovanadium: Open-hearth Grade (V 50-55%, Si 8% max, C 3% max). Contract, any quantity, \$3.10 per lb of contained V. Delivered. Spot, add 10c. **Special Grade** (V 50-55% or 70-75%, Si 2% max, C 0.5% max) \$3.20. **High Speed Grade** (V 50-55%, or 70-75%, Si 1.50% max, C 0.20% max) \$3.30.

Grainal: Vanadium Grainal No. 1, \$1.05 per lb; No. 6, 68c; No. 79, 50c, freight allowed.

Vanadium Oxide: Contract, less carload lots, packed, \$1.33 per lb contained V₂O₅, freight allowed. Spot, add 5c.

SILICON ALLOYS

25-30% Ferrosilicon: Contract, carload, lump, bulk, 20.0c per lb of contained Si. Packed 21.40c; ton lot 22.50c f.o.b. Niagara Falls, N. Y., freight not exceeding St. Louis rate allowed.

50% Ferrosilicon: Contract, carload, lump, bulk, 12.75c per lb of contained Si. Packed, c.l. 14.85c, ton lot 16.3c, less ton 17.95c. F.o.b. Alloy, W. Va., Ashtabula, Marietta, O., Sheffield, Ala., and Portland, Ore. Spot, add 0.45c.

Low-Aluminum 50% Ferrosilicon: (Al 0.40% max). Add 1.2c to 50% ferrosilicon prices.

65% Ferrosilicon: Contract, carload, lump, bulk, 14.5c per pound contained silicon. Packed, c.l. 16.2c, ton lots, 18c; less ton, 19.35c. Delivered. Spot, add 0.35c.

75% Ferrosilicon: Contract, carload, lump, bulk, 15.4c per lb of contained Si. Packed, c.l. 17.05c, ton lot 18.7c, less ton 19.95c. Delivered. Spot, add 0.3c.

90% Ferrosilicon: Contract, carload, lump, bulk, 18.5c per lb of contained Si. Packed, c.l. 19.95c, ton lot 21.35c, less ton 22.4c. Delivered. Spot, add 0.25c.

Silicon Metal: (Min 98% Si, 0.75% max Fe, 0.07 max Ca). C.l. lump, bulk, 20.5c per lb of Si. Packed, c.l. 21.95c, ton lot 23.25c, less ton 24.25c. Add 0.5c for max 0.03 Ca grade. Deduct 0.5c for max 2% Fe grade analyzing min 96.5% Si. Spot, add 0.25c.

Alsifer: (Approx. 20% Al, 40% Si, 40% Fe). Contract, basis f.o.b. Niagara Falls, N. Y., lump, carload, bulk, 10.65c per lb of alloy, ton lots packed 11.8c.

ZIRCONIUM ALLOYS

12-15% Zirconium Alloy: (Zr 12-15%, Si 39-43%, C 0.20% max). Contract, c.l. lump, bulk 8.5c per lb of alloy. Packed, c.l. 9.5c, ton lot 10.65c, less ton 11.5c. Delivered. Spot, add 0.25c.

35-40% Zirconium Alloy: (Zr 35-40%, Si 47-52%, Fe 8-12%, C 0.50% max). Contract, carload, lump, packed 26.25c per lb of alloy, ton lot 27.4c, less ton 28.65c. Freight allowed. Spot, add 0.25c.

BORON ALLOYS

Ferroboron: (B 17.50% min, Si 1.50% max, Al 0.50% max, C 0.50% max). Contract, 100 lb or more 1" x D \$1.20 per lb of alloy; less than 100 lb \$1.30. Delivered. Spot, add 5c. F.o.b. Washington, Pa., prices, 100 lb and over, are as follows: Grade A (10-14% B) 85c per pound; Grade B (14-18% B) \$1.20; Grade C (19% min B) \$1.50.

Borasil: (3 to 4% B, 40 to 45% Si). \$5.25 per lb contained B, delivered to destination.

Bortam: (B 1.5%-1.9%). Ton lots, 45c per lb; smaller lots, 50c per lb.

Carbortam: (B 1 to 2%). Contract, lump, carloads 9.50c per lb, f.o.b. Suspension Bridge, N. Y., freight allowed same as high-carbon ferrotitanium.

CALCIUM ALLOYS

Calcium-Manganese-Silicon: (Ca 16-20%, Mn 14-18% and Si 53-59%). Contract, carload, lump, bulk 22c per lb of alloy, carload packed 23.05c, ton lot 24.95c, less ton 25.95c. Delivered. Spot, add 0.25c.

Calcium-Silicon: (Ca 30-33%, Si 60-65%, Fe 1.5-3%). Contract, carload, lump, bulk 21.5c per lb of alloy, carload packed 22.95c, ton lot 25.25c, less ton 26.75c. Delivered. Spot, add 0.25c.

BRICQUETTED ALLOYS

Chromium Briquets: (Weighing approx. 3 1/2 lb each and containing 2 lb of Cr). Contract, carload, bulk, 16.95c per lb of briquet, carload packed in box pallets 17.15c, in bags 17.85c; 3000 lb to c.l. in box pallets 18.35c; 2000 lb to c.l. in bags, 19.05c; less than 2000 lb in bags 19.95c. Delivered. Add 0.25c for notching. Spot, add 0.25c.

Ferromanganese Briquets: (Weighing approx. 3 lb and containing 2 lb of Mn). Contract, carload, bulk 13c per lb of briquet, c.l. packed, pallets 13.2c, bags 14c; 3000 lb to c.l., pallets 14.4c; 2000 lb to c.l. bags, 15.2c, less ton 16.1c. Delivered. Add 0.25c for notching. Spot, add 0.25c.

Silicomanganese Briquets: (Weighing approx. 3 1/2 lb and containing 2 lb of Mn and approx. 1/2 lb of Si). Contract, c.l. bulk 13.55c per lb of briquet, c.l. packed, pallets, 13.75c; bags 14.55c, 3000 lb to c.l., pallets, 14.95c; 2000 lb to c.l., bags, 15.75c; less ton 16.65c. Delivered. Add 0.25c for notching. Spot, add 0.25c.

Silicon Briquets: (Large size—weighing approx. 5 lb and containing 2 lb of Si). Contract, carload, bulk 7.15c per lb of briquet; packed, pallets, 7.35c; bags, 8.15c; 3000 lb to c.l., pallets, 8.95c; 2000 lb to c.l. bags 9.75c; less ton 10.65c. Delivered. Spot, add 0.25c.

(Small size—weighing approx. 2 1/2 lb and containing 1 lb of Si). Carload, bulk 7.3c. Packed, pallets 7.5c; bags 8.30c; 3000 lb to c.l. pallets 9.1c; 2000 lb to c.l. bags 9.9c; less ton 10.8c. Delivered. Add 0.25c for notching, small size only. Spot, add 0.25c.

Molybde-Oxide Briquets: (Containing 2 1/2 lb of Mo each) \$1.33 per pound of Mo contained, f.o.b. Langeloth, Pa.

TUNGSTEN ALLOYS

Ferrotungsten: (70-80%), 5000 lb W or more \$3.45 per lb of contained W; 2000 lb W to 5000 lb W, \$3.55; less than 2000 lb W, \$3.67. Delivered.

OTHER FERROALLOYS

Ferrocolumbium: (Cb 50-60%, Si 8% max, C 0.4% max). Contract, ton lot, 2" x D, \$6.90 per lb of contained Cb. Delivered. Spot, add 10c.

Ferrotantalum—Columbium: (Cb 40% approx., Ta 20% approx., and Cb plus Ta 60% min C 0.30% max). Ton lots, 2" x D, \$4.65 per lb of contained Cb plus Ta, delivered; less ton lots \$4.70.

SMZ Alloy: (Si 60-65%, Mn 5-7%, Zr 5-7%, Fe 20% approx.) Contract, c.l. packed 1/2 in. x 12 M, 18.5c per lb of alloy, ton lots 19.65c, less ton 20.9c. Delivered. Spot, add 0.25c.

Graphidox No. 5: (Si 48-52%, Ca 5-7%, Ti 9-11%). C.l. packed 18.5c per lb of alloy, ton lots 19.65c, less ton lots 20.9c, f.o.b. Niagara Falls, N. Y., freight allowed to St. Louis.

V-5 Foundry Alloy: (Cr 38-42%, Si 17-19%, Mn 8-11%). C.l. packed 17.2c per lb of alloy; ton lots 18.7c; less ton lots 19.95c, f.o.b. Niagara Falls, N. Y., freight allowed to St. Louis.

Siminal: (Approx. 20% each Si, Mn, Al; bal. Fe). Lump, carload, bulk 17.50c. Packed c.l. 18.50c, 200 lb to c.l. 19.50c, less than 2000 lb 20c per lb of alloy. Delivered.

Ferrophosphorus: (23-25% based on 24% P content with unitage of \$4 for each 1% of P above or below the base; carload, f.o.b. sellers' works, Mt. Pleasant, Siglo, Tenn., \$90 per gross ton.

Ferromolybdenum: (55-75%). Per lb contained Mo, in 200-lb containers, f.o.b. Langeloth, Pa., \$1.54 in all sizes except powdered which is \$1.66; Washington, Pa., furnace, any quantity \$1.46.

Technical Molybde-Oxide: Per lb contained Mo, f.o.b. Langeloth, Pa.; \$1.31 in cans; in bags, \$1.30, f.o.b. Langeloth, Pa.; \$1.24, Washington, Pa.

than 500 tons in February and possibly 100 tons or so in March. Virtually nothing is up for bids in April so far.

There has been fairly sustained inquiry for road building and more than usual for concrete bridges. Fabricators ascribe the lag in demand for structural steel bridges as due in part to the sold-up condition of shops.

Warehouse . . .

Warehouse Prices, Page 137

Warehouses continue under pressure for those steel items (plates and structurals) in shortest supply at the mill level. With mill allotments unchanged and tonnage moving out to consumers almost as quickly as received, it is practically impossible for the distributors to keep anything like a supply balance in these items.

Much the same situation holds for the other products. Sheets are in somewhat better availability. The same is true of bars. The warehouses can sell all the tonnage they can obtain, but some sellers anticipate soft spots to develop in demand in such products as merchant pipe, manufacturers wire, galvanized sheets and fasteners.

Imported Steel Prices Firm

Demand for imported steel is steady, with delivery promises by Western European producers on the major products tightening. Promises on commercial bars now average four months; on standard shapes, four to six months; and on wide flange sections, five to seven months. Plates are quoted for delivery in four to six months, and hot rolled sheets, three months.

This situation reflects not only relatively good demand here but also active domestic requirements in the countries of production and in certain other parts of the world.

Prices have advanced \$4 a ton on I-beams and \$2 a ton on furring channels. Most other items are strong but unchanged.

Inquiry continues particularly strong for oil country pipe. Deliveries range seven to nine months, it is reported.

Steel Import Prices

(Base per 100 lb. landed, duty paid. Source of shipment: Western continental European countries)

	North Atlantic	South Atlantic	Gulf Coast	West Coast
Deformed Bars, Intermediate, ASTM-A-305...	\$6.80	\$6.80	\$6.80	\$7.20

KARDONG FOUR-WAY BENDER

For Concrete Reinforcing Bars

Model D-2

The Model D-2 Kardong Bender is a Four Direction Horizontal Bender. With this bender it is not necessary to turn bars over to make reverse or second bends on beam bars. The Model D-2 is made in two sizes, Model D-2 Standard 6-inch, which will bend bars around collars 2-inch to 6-inch, and Model D-2 Special 8-inch, which will bend bars around collars 2-inch to 8-inch. Capacity of both models, 1 1/4-inch Square Bars. The Model D-2 is a production bender for reinforcing steel fabricating shop. Ask for catalog of our complete line of reinforcing bar benders.

EDWIN J. THOMAS

Portrait by Fabian Bachra

“...added over 20,000 employees to The Payroll Savings Plan.”

“The Savings Bond Program—like any other program in a corporation—will succeed *only* if it has the complete support of top management. Recently the Goodyear Tire & Rubber Company added over 20,000 employees to the Payroll Savings Plan, attaining an overall participation of over 71%. While the drive itself was successful I feel the job is only half done. Now we are installing a program to maintain this high peak of participation. Such a program will constantly keep the merits of the program before each employee, encouraging him to provide his own security through this

effortless plan of saving.”

EDWIN J. THOMAS, President
The Goodyear Tire & Rubber Company, Inc.

What is the percentage of employee participation *your* Payroll Savings Plan? If it is less than 50%, get touch with Savings Bond Division, U.S. Treasury Department, Washington, D. C. Your State Sales Director will be glad to help you increase your participation 60% or higher. A phone call, telegram or letter Savings Bond Division, U.S. Treasury Department will bring a prompt response.

The United States Government does not pay for this advertising. The Treasury Department thanks, for their patriotic donation, the Advertising Council and

Scrap . . .

Scrap Prices, Page 150

Pittsburgh—One major steelmaker ere bought a small but significant onnage of No. 1 heavy melting scrap t \$54 last week. It also paid \$48 or No. 2 heavy melting and \$46 for o. 2 bundles. The price was \$6 ove the amount paid for No. 1 eavy melting by that firm last onth, when it made a slightly larg-r purchase. Brokers have been pay-g up to \$51 to cover \$48 orders or the principal scrap grade in the ast half of March. Other grades ave moved up \$1 or \$2.

Philadelphia—Prices have taken a urther sharp spurt on relatively mall buying by district independent uills. The Fairless, Pa., consumer ough No. 1 steel at \$53. Strength is ttributed in part to scarcity of ma-erial at dealers' yards and to urgent eed for scrap at some consuming lants. Export requirements also are eing stepped up, although some as-ert that not too much significance ould be ascribed to this as some of the Midwest markets were the irst to show strength on the present ovement.

Cleveland—A substantial purchase f top-quality steelmaking scrap by valley mill at \$59, delivered, has ushed prices up sharply on the steel rades both in the Valley and here. enerally, No. 1 heavy melting is uoted \$57-\$58 in the Valley, and \$54-\$55 here. Relative scarcity of scrap and high steelmaking opera-ons contribute to market strength.

Chicago — Once more the scrap market here is close to or at all-time igh prices. In the last few days, uotations on steelmaking grades ave inched up \$2 to \$6 a ton. Part of the strength is reflected in broker-lealer transactions, but subsequent ill purchases of a few grades have onfirmed the bullish market swing. Shortages are developing in some grades as steelmaking continues at ear capacity output. Cast grades so far are not following the upward rend.

Boston — Steel scrap prices are rmer on limited new buying. The rend is expected to continue as con-sumers re-enter the market for ton-age. Higher freight to Pittsburgh will cut deeper into shipments to hat area from New England. Al-though recent yard receipts were lown, stocks in most cases are fair, mple in the secondary grades.

New York—Scrap brokers have ad-anced buying prices on several grades reflecting the strength now ominating various district markets. They are offering \$45-\$47 for No. 1

heavy melting and No. 1 bundles, \$39-\$40 for No. 2 heavy melting and \$34-\$35 for No. 2 bundles. Prices for machine shop turnings have been increased to \$28-\$30; mixed borings and turnings to \$29-\$31; short shovel turnings to \$32-\$33; and low phos structural and plate to \$48-\$50. Un-stripped motor blocks are higher at \$31-\$33.

Buffalo—Heavy demand for area scrap for shipment to Youngstown has resulted in an increase of about \$3 a ton in the price of No. 1 heavy melting steel here. Brokers are get-ting \$50-\$51 for No. 1 heavy melt-ing for shipment to the Ohio Valley. Machine shop turnings also are quot-ed \$1 higher at \$28.

Cincinnati—Prices have moved up \$1 per ton on all grades. Brokers think the current strength could de-velop a runaway market situation, especially should consumers rush the market for anticipated require-ments.

Detroit—The scrap market here is being influenced by revival of de-mand for finished steel in the auto industry. This is notably true in the case of electric furnace scrap. The rising demand for scrap stemming from the pickup in auto steel re-quirements is expected to influence higher scrap prices shortly.

St. Louis—Scrap prices have sky-rocketed here, with brokers' pur-chase rates going up in almost every category. Increases ranged from \$1 to \$6.50. Biggest rises were in re-rolling rails (from \$65 to \$70.50) and angles and splice bars (\$54 to \$60.50).

All other rail scrap is higher. Also: Heavy melting scrap, bundles, bush-eling, machine shop turnings and short shovel turnings. Cast iron grades showed a price advance in each group, with the exception of brake shoes and clean auto cast.

Birmingham — The scrap market continues weak. Many dealers, es-pecially in the Carolinas, are ship-ping to northern consumers. Two open-hearth buyers in this area halt-ed shipments after making sizable purchases. The steel export market and the cast iron market appear strong, but no price changes are re-ported.

Los Angeles—Machine shop turn-ings are off \$1 to \$17 per ton and area dealers anticipate further de-cline. Market instability is attribut-ed to several factors, chiefly erratic mill purchases and increasing avail-ability of offshore scrap.

San Francisco — Underlying strength prevails in the local steel scrap market, with mills continuing

to melt as much metal as ever. One large consumer is operating at 113 per cent of rated capacity. Its fur-naces are on a virtual 100-per-cent-scrap charge.

Seattle—Scrap is stronger. While No. 1 and No. 2 heavy melting are unchanged at \$38 and \$35, respec-tively, recent Navy sales indicate underlying strength. At the Puget Sound yard 400 tons of No. 1 pre-pared brought \$41.56, and 1000 tons of unprepared were bid at \$34.67, to which freight of \$2.70 to Seattle must be added.

The mills have recently specified two categories, for No. 2 heavy melting offering \$35 for 3 ft or less, and \$33 for 5 ft or more. Other cur-rent prices: No. 1 bundles, \$35; No. 2, \$26; motor blocks, \$35; No. 1 cu-pola, \$40-\$42.

Metallurgical Coke . . .

Metallurgical Coke Prices, Page 147

Production of coke in January to-taled 6,915,071 net tons, reports the U. S. Bureau of Mines. This compares with 6,865,032 tons in the preceding month and with 5,805,926 in January, 1955. Of total production in the month, 6,660,284 tons were oven coke and 254,787 tons, beehive.

Stocks of oven coke held by pro-ducers at the end of January were 1,648,673 tons, equal to 7.7 days of production. At the end of December the total was 1,697,200 tons, and at the end of January a year ago, the total was 2,747,638 tons.

Pig Iron . . .

Pig Iron Prices, Page 137

Several producers announced in-creases of \$1.50 per ton on the various grades of pig iron, starting with the announcement Mar. 25 by Colorado Fuel & Iron Corp. and subsidiaries. Other makers to take similar action up to the middle of last week in-cluded Alan Wood Steel Co., Pitts-

accident...

When you buy *Acme-Gridley*
you get **SERVICE**
ANYTIME, ANYWHERE

"Accidents don't just happen, they are caused," says a safety expert. But regardless of when or how they occur, you should know that good service can reduce downtime and expensive delays.

In this case, several Acme-Gridleys sustained damages that included broken control panels, cracked top plates, crushed conduits, and broken motor frame castings and guards. Prompt action of our service department got replacement parts to this user quickly—minimized his production losses.

National Acme

The NAMCO nameplate on your machine assures service — in emergency or normal situations — when and where you need it.

THE NATIONAL ACME COMPANY • 189 East 131st Street, Cleveland 8, Ohio

(Concluded from page 149)

burgh Coke & Chemical, Shenango Furnace, Bethlehem Steel Co., Tonawanda Iron, Phoenix Iron, Interlake Iron, Youngstown Sheet & Tube and Wisconsin Steel.

The increase, which reflects higher transportation and raw material costs, is expected to become general throughout the industry over the next week or so at latest.

There also has been some protective covering on coke, because of rumors that an advance may be made early in April. And consumers have not been unmindful of recent advances in prices on ferromanganese and spiegeleisen. Some attach special significance to these increases as they relate to pig iron; and also to the reports of possibly higher prices on coke.

Pig iron shipments in March were at capacity level in the Chicago district, and order books of sellers indicate that April will follow the same pattern.

Blast furnace production totaled 6,602,817 net tons in February, reports the American Iron & Steel Institute. This compares with 7,049,566 tons in January.

Of the total production in the month, 6,539,199 tons were pig iron and 63,618 tons, ferromanganese and spiegeleisen. In February, 1955 5,394,585 tons of pig iron and 48,182 tons of ferroalloys were produced.

Production (pig iron and ferroalloys) in the first two months this year amounted to 13,652,381 tons against 11,227,420 tons in the like period of last year.

BLAST FURNACE PRODUCTION (Net Tons)

Districts	1955		1954
	February	2 Months	2 Months

Iron Ore . . .

Iron Ore Prices, Page 147

There are 100,000 tons of Nevada iron ore on Stockton, Calif., docks awaiting shipment to Japan. But lack of freighter space is delaying the movement. The pile-up has tied up several hundred gondola cars. One shipping line has offered to move 30,000 tons of the ore, but it asks rates ranging from \$14 to \$16 a ton, almost double its rates with Japanese steel mills a year ago.

Imports of iron ore into the U. S.

Half-way To OUTER SPACE ... in an ACME Weldment

Inside this steel test chamber men and equipment will face the impact of supersonic flight, *without leaving the laboratory*. Extremes of altitude, temperature, and humidity will yield their secrets to special equipment and instruments. To make possible the many unusual design features, to assure maximum strength with minimum weight, the engineers specified that the complex shell be fabricated by Acme Welding . . . one more dramatic example of the part played in industry today by Acme weldments. Perhaps an Acme weldment can improve your product. Why not call on Acme today.

HERE'S HELP
for
your tooling
problems

Looking for a tool steel to do a specific job? Want to know where to buy a finishing carbide? This guide has the answers. It is a single source of information on more than a thousand different tooling materials. Knowing the job to be done, you can determine, with the guide, what product to buy and where to buy it. Cross indexes make it easy to locate tool steels and carbides by tradename, or to compile a list of sources for a single type.

JUST PUBLISHED

New Farval spray panel

lubricates gearing automatically,
efficiently, inexpensively

FARVAL—
*Studies in
Centralized
Lubrication*
No. 183

HERE'S how to do a better job of greasing gears and save a lot of lubricant and labor besides. Just install Farval Spray Valves. They can reduce oil and grease consumption and oiling labor as much as 95%. Then you can throw away the oil can and grease bucket, and put your oilers on other constructive work.

Shown at right is a new Farval Spray Valve System developed for large-diameter wide-faced gears. Installed on a panel mounted on the gear housing are Dualine valves, spray valves and reversing valve. An automatic air-operated barrel pump supplies the lubricant.

Farval Spray Valves are completely flexible as to arrangement and operation. They can be used alone or as part of a Dualine System—wherever a supply of compressed air is available. As with standard Dualine valves, the spray can be operated as often or as infrequently as needed to deliver any desired amount of oil or grease, on gears, sliding bearing surfaces or other areas needing lubrication. There is no waste or mess. Quantity of air used is limited to the exact amount required to spray each delivery of oil or grease.

Hundreds of Farval Spray Valve Systems are now in use in many industries. Why not investigate this simple, inexpensive method for your own plant equipment? Tell us the type of gearing or machines for which you would consider automatic spray lubrication. One of our field representatives will be glad to recommend the Farval system best suited to your needs. Write for Bulletin 26-R. The Farval Corporation, 3270 East 80th Street, Cleveland 4, Ohio.

Affiliate of The Cleveland Worm & Gear Company, Industrial Worm Gearing. In Canada: Peacock Brothers Ltd.

Above—cutaway view shows spray lubrication of wide-faced gear by set of 3 Farval Spray Valves mounted on a special panel which also carries 3 Dualine valves and a reversing valve. At left is the automatic air-operated barrel pump which supplies lubricant to the Farval Spray Valve System. Spray valves may be operated manually also.
